

Snapdragon Cockpit Elite and Ride Elite

Qualcomm's vision for AI-powered smart cars

Jayesh Shinde | jayesh@digit.in

The future of cars is no longer just about engines and horsepower, and Qualcomm's latest Snapdragon platforms are making sure the cars of tomorrow are as smart as they are powerful, with AI playing a big part in this evolution. At the 2024 Snapdragon Summit in Maui, Qualcomm unveiled two key platforms that aim to redefine the automotive experience: the Snapdragon Cockpit Elite and Snap-

dragon Ride Elite. Both platforms are AI-driven, software-defined, and tailor-made to transform the car into a high-performance, responsive, and adaptable device on wheels.

As more automakers move towards software-defined vehicles (SDVs), cars are evolving from machines driven by mechanical components to intelligent devices powered by real-time software updates and AI capabilities – an industry in which Qualcomm wants to have a

big influence going forward. This shift mirrors what smartphones went through a decade ago, moving from static hardware-focused devices to flexible platforms where software is king. With Snapdragon Cockpit Elite and Ride Elite, Qualcomm is bringing that same level of intelligence, personalisation, and adaptability to cars.

AI at the wheels

At the heart of these new platforms is Qualcomm's powerful AI architecture, designed to turn cars into self-aware, responsive companions on the road. Qualcomm's new Oryon CPU is the brain powering these platforms, but the real magic happens in the Neural Processing Unit (NPU). This NPU delivers a 12x boost in AI performance compared to Qualcomm's previous automotive platforms. In simple terms, it means that the car's ability to think, adapt, and react to its environment just got a lot smarter.

Imagine a car that can process real-time data from cameras, sensors, and even the driver's own behaviour to make split-second decisions, all thanks to Qualcomm's advanced AI capabilities. The AI
