

I liked the iPad Mini

...but when I used it as a computer, I loved it

Yetnesh Dubey | yetnesh@digit.in

Apple's iPads have always been a subject of debate. For creative professionals like designers and sketchers, it's a dream device. But for the average user? The purpose feels a bit vague. After all, if you want to watch movies, play games, or scroll through social media, your smartphone or laptop already ticks those boxes. So where does the iPad fit in?

Apple's new iPad Mini 7 attempts to answer this by shrinking the form factor. It's small enough to not be a smartphone but remains bigger and more versatile. After using it for over a month, here's what I think about it.

Design and display

The iPad Mini 7 sticks to its predecessor's design language—compact and lightweight. It has an 8.3-inch Liquid Retina display, an LCD panel that's

bright enough at 500 nits for indoor use. Outdoors, it works fine in the shade, but the glossy screen might bother some, for those who prefer matte displays, a screen protector (costing around ₹500) solves the problem.

However, the bezels feel outdated in 2024. They not only look ancient but also rob the device of valuable screen real estate.

Another surprising omission? No haptic feedback. Apple's iPhones boast industry-leading haptics, so typing on the iPad Mini feels oddly hollow. This is a feature Apple should seriously consider for future models.

Hardware and performance

The Mini 7 packs a punch with the
