

StuffCool Giga 65W

A 20000 mAh powerbank your gadgets deserve

Jayesh Shinde | jayesh@digit.in

Let's be honest for a second: in a world where every gadget claims to be "game-changing," powerbanks tend to be painfully unremarkable. But every once in a while, one comes along that actually catches my attention. Enter the StuffCool Giga 65W Powerbank – a compact 20,000mAh behemoth that defies its own size and weight. I spent the past few days using it to charge everything from smartphones to TWS earphones, even a 15-inch laptop. At the end of it all, I have to say that calling the StuffCool Giga 65W just another powerbank feels a bit like calling a Ferrari "just another car."

The Giga is not only petite at 6.8 x 10.8 x 3.25 cm but also surprisingly

light, weighing just about 380 grams. Unlike most powerbanks you've used, the StuffCool Giga easily slides into a bag or purse without making you feel like you're carrying a brick. Apart from a prominent charging display indicator, the StuffCool Giga's built-in USB-C cable is thoughtfully designed – it's small enough to not make you carry a long wire while charging your phone, but just big enough so that it forms a loop around your wrist. The real winner here is the built-in Type-C cable with up to 65W PD output. If you're the sort who always forgets to pack cables (like yours truly), this powerbank is a lifesaver. I tested the cable on a whole host of devices, and it delivered a fast, no-fuss charge that reminded me of a standard

wall adapter. And if you own a Samsung Galaxy phone, the Giga's 45W Super-Fast Charging 2.0 support might make you weep with joy.

While putting the StuffCool Giga through its paces, I started off small – charging my AirPods Pro 2 case and in-ear pods. Both were under 10%, and fully topping them up took a mere 6% of the Giga's capacity, and just under 15 minutes. It barely broke a sweat, I must admit. Encouraged, I moved on to the iPhone 15 Pro. One test saw me go from 22% to 71% in just over half an hour, eventually hitting 100% just under the 2-hour mark of overall charging time, but that includes the typical iPhone "trickle charge" past 80%. Another session of recharging the iPhone 15 Pro took me from 4% to 100% in about an hour and 45 minutes, which is quite decent – especially when you consider the phone's battery was almost drained.

Now, the real test: my 15-inch Infinix laptop charged over the USB Type-C port. I started at 47% around 8:00 pm with the Giga at full charge. Within a half hour, I jumped to 62% of laptop battery. By 9:23 pm, the laptop was cruising at 92%, and the Giga still had 24% left. Hitting 100% on the laptop left about 7% in the tank – enough to top up a phone by at least 35-40% if I was in a pinch.

A power bank is only as good as its recharge time. Using StuffCool's own 18W charger, it took me around two and a half hours to climb from 7% to 70% of charge on the StuffCool Giga. With a 67W charger (from Xiaomi), though, the Giga soared from nearly empty (1% charge) to 100% full in about 90 minutes. That's a game-changer if you're constantly on the go and can't waste hours waiting for your powerbank to revive.

The Giga offers a Type-C port that can push 65W, plus a USB-A port at 18W for your older gadgets or devices that don't require super-fast charging. I also gave the Giga a whirl on two Android phones at the same time, and needless to say both charged seamlessly, no adapters or fuss required. That's the kind of versatility that's expected from
