

Graphics Cards

Sharper frames, smarter tech

The graphics card market in 2024 has been marked by refinement rather than revolution. NVIDIA continued to lead the charge with its “Super” series refresh, bringing incremental performance upgrades to its RTX 40-series. Meanwhile, AMD has focused on making high-performance mid-range GPUs more accessible, with its Radeon RX 7600. That being said, 2024 was not the year to see new launches, instead at CES 2025 we saw several new GPU announcements from NVIDIA as well as AMD; NVIDIA with its RTX 50 series graphics cards and AMD with the introduction of the RDNA 4 family of Radeon Graphics cards. Graphics cards haven’t been solely for gaming for quite a few years now and with the coming years, there’s a tremendous push to democratise AI for not just developers but even the average gamer. That also means we need to relook at how we test graphics cards but that’s a story for another day. Let’s look at this year’s winners.

Winner: ZOTAC RTX 4080 Super AMP

The ZOTAC RTX 4080 Super takes the crown this year with its unbeatable combination of performance and feature set. NVIDIA’s refreshed Ada Lovelace architecture delivers a significant boost in ray tracing performance, making games look sharper and more immersive than ever before. Paired with DLSS 3.5, the RTX 4080 Super enables smoother frame rates, even in demanding 4K gaming scenarios. The ZOTAC RTX 4080 Super is also a powerhouse for productivity tasks, excelling in video rendering, AI workloads, and 3D modelling. Its efficient thermal design and quiet operation ensure consistent performance, even under heavy loads.

While it comes with a hefty price tag, its exceptional performance justifies the investment for gamers and creators seeking the best of the best.

Runner-Up: Gigabyte RTX 4070 Ti Super

The Gigabyte RTX 4070 Ti Super is a strong contender in the premium segment, offering excellent performance for its price. With a slight boost in core count and memory speeds over its predecessor, this card handles 1440p and 4K gaming with ease. Its ray tracing capabilities, while not equal to the RTX 4080 Super, remain impressive, delivering immersive visuals in supported titles. The RTX 4070 Ti Super is particularly well-suited for creators, with enhanced performance in applications like Adobe Premiere Pro and Blender. Its efficient design ensures lower power consumption, making it a solid choice for those who value performance without the power demands of higher-end models.

Best Buy: AMD Radeon RX 7600

AMD’s Radeon RX 7600 claims the Best Buy award for its exceptional value. Aimed squarely at budget-conscious gamers, the RX 7600 delivers outstanding performance for 1080p gaming. It handles popular eSports and AAA titles with ease, offering smooth frame rates and reliable performance. Though it lacks in the ray tracing department compared to its cousins there’s always AMD’s FSR 3.0 technology which helps bridge the gap by improving performance in supported games. The RX 7600 is also a power-efficient card, making it an excellent choice for compact builds or systems with limited power supply capacity. Its competitive pricing makes it a standout option for gamers on a budget.
