India has about 700 million smartphone users, with close to 14 billion UPI transactions worth ₹20 lakh crores happening on a monthly basis. Beneath the glossy veneer of consumer technology lies this complex ecosystem where smartphone innovation meets the necessity of digital commerce. And safeguarding these devices and the apps ecosystem inside them goes beyond a simple antivirus program. It's about runtime defenses, cloud-based analytics, and AI-driven intelligence that adapt to evolving cyber threats, according to Pankaj Patankar, Head of Marketing for Protectt.ai Labs Pvt Ltd.

In an exclusive interview, Patankar explains how Protectt.ai is aiming to reshape the mobile app security landscape. What struck me most was Protectt.ai's intense focus on real-time, in-app threat protection and the level of sophistication they bring to fighting the

hidden – and sometimes not-so-hidden – adversaries lurking behind every suspicious link, tampered APK, or cleverly disguised piece of malware.

Providing constant mobile app security

Mobile security is often portrayed as a tug-of-war between developers who patch vulnerabilities and hackers who exploit them. Protectt.ai flips this dynamic on its head. Their approach is not just to block known threats, but to anticipate and neutralise them as they happen.

"At Protectt.ai, our core strengths in the mobile app security landscape are centred around our advanced Runtime Application Self-Protection (RASP) technology, which sets us apart from

competitors," Patankar explained. The mention of RASP (Runtime Application Self-Protection) particularly piqued my interest. Rather than relying solely on perimeter defences, RASP technology defends the app from within, making it harder for attackers to manipulate code or data.

As Patankar put it, "We leverage sophisticated AI and ML algorithms for enhanced threat detection, allowing us to adapt quickly to evolving attack vectors." It's a sentiment that encapsulates the company's approach: treat security as a living, evolving system, not a static checklist of defences.

Traditional mobile antivirus solutions rely on signature-based detection, which are great for known threats but less effective against zero-day exploits or entirely new malware species. Protectt.ai, on the other hand, uses a cloud-based analysis system and next-gen runtime capabilities.

"Our RASP solution provides continuous, in-app security, detecting and responding to threats as they occur, ensuring immediate mitigation of
