Meta AI will now use Facebook and Instagram data to offer more personalised responses

Meta AI has become one of the most popular chatbots, available on platforms such as Instagram, Facebook, and WhatsApp. Users can ask questions and converse with the AI, which provides useful answers. Meta has recently introduced several exciting new features, including Memory Boost and personalised recommendations. Here's everything you should know about Meta AI's most recent updates.

Memory Boost Feature

Meta announced the Memory Boost feature, which will allow the chatbot to remember several things, including 1:1 chats on WhatsApp and Messenger. With this feature, the company hopes to provide more relevant responses by retaining context from previous

conversations. The Memory Boost feature is now available to Meta AI on Facebook, Messenger, and WhatsApp for iOS and Android users in the United States and Canada, with additional countries to follow. Users will have the ability to delete any information the AI remembers at any time.

Personalised Recommendations

Second, Meta is giving Meta AI a more personalised touch by providing more targeted content recommendations. The chatbot will now use data from users' Facebook profiles, recent activities, and interactions to make suggestions based on their preferences. For example, if a user requests a fun family getaway, the chatbot may recommend a country music concert in their area based on their location, family information, and previous interests. <https://tinyurl.com/3huvdca5>

iOS 18.3 update is now available for iPhone users

Apple has finally introduced the much anticipated iOS 18.3 update for all eligible iPhones with new features and bug fixes. However, this is not the biggest update for Apple Intelligence lovers. The update has

brought some key changes to the Notification summaries, including a fix for the calculator, which now repeats the last mathematical operation when you tap the equals sign again. Here's

everything you need to know about the new Apple iOS update.

The new iOS 18.3 update improves visual intelligence with Camera Control for all iPhone 16 models. Users will now be able to add events to their calendars simply by scanning posters or flyers. It can also recognize plants and animals with the feature. Furthermore, users can manage notification summaries directly from the Lock Screen, and the updated style for summarized notifications now includes italicized text and a glyph to differentiate them. However, notification summaries for News & Entertainment apps are currently unavailable; however, users who opt-in will see them again once the feature becomes available.

Uber responds to accusations of showing different prices to Android and iPhone users

On social media, for a while now, netizens have been claiming that there has been a price discrepancy in the prices that Uber and Ola show to iPhone and Android users. Users claimed that these platforms set ride prices based on the user's phone model. Responding to these claims, the Central Consumer Protection Agency (CCPA) sent notices to Uber and Ola. The former has now responded to these allegations.
