Google is working on making your Gmail safer and more secure

As the online world becomes more complicated, it becomes even more critical for us to stay safe. In this regard, tech giants are also trying to keep malicious activities under track. For the same reason, Google is planning to phase out SMS-based six-digit authentication codes for Gmail and replace them with QR code verification, according to a Forbes report. The company aims to reduce SMS-related security risks and prevent fraudsters from exploiting vulnerabilities in traditional two-factor authentication (2FA).

iPhone 17 series may get Apple's in-house chips for faster WiFi and Bluetooth connectivity

Apple's iPhone 17 series is generating a lot of buzz as we approach its expected release in September. The new iPhones are

expected to bring significant changes in design, performance, and camera features. One of the most exciting updates could be Apple's shift to

in-house WiFi chips, which may enhance connectivity across its devices.

Renowned analyst Ming-Chi Kuo has shared on X that Apple will replace third-party WiFi chips with its own. According to Kuo, all iPhone 17 models will feature Apple-designed WiFi chips. "Following Qualcomm, Broadcom's Wi-Fi chips will also be replaced by Apple's in-house chips at a faster pace. My latest industry survey indicates that all new 2H25 iPhone 17 models will feature Apple's in-house Wi-Fi chips (vs. only the slim iPhone 17 will adopt Apple's C1 modem chip). Beyond cost reduction, the switch to in-house Wi-Fi chips will enhance connectivity across Apple devices," Kuo wrote on X.
