

CS2 crusades & GPU gymnastics

Just as the confetti of New Year's resolutions began to settle, February stormed in with its own blend of tech chaos, bittersweet farewells, and gaming crusades. Between GPU acrobatics, office nostalgia, and Satvik's never-ending CS2 recruitment drive, here's how the Digit crew stumbled, triumphed, and memed their way through another month of delightful disorder.

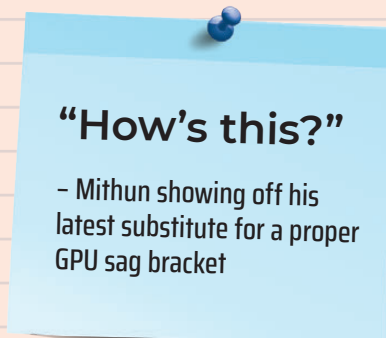

The call of CS2

Some legends never die, and some just refuse to let CS2 die. Satvik, in his unyielding crusade to convert the uninitiated, spent the better half of the month coaxing, pleading, and borderline bribing folks into matchmaking. Every lunch break turned into a tactical debrief, every coffee run a recruitment opportunity. "It's just one game, bro," became the office's unofficial catchphrase – a phrase that, in reality, meant at least three hours of getting headshot in Dust II.

His persistence earned him a mix of admiration and fear; some dodged eye contact, others embraced the inevitable. By week's end, he had successfully roped in two finance folks and a bewildered reception rep. Victories come in strange forms.

Smiles cloak the tears

In the midst of frame rates and refresh rates, the team faced a bittersweet goodbye. Ali, the mastermind behind

our Mumbai production magic, wrapped up his journey with Digit. Since September 2021, he had been the quiet force behind some of our most polished work – a wizard in the editing bay, a maestro with the camera, and the sole person who could make Mumbai team in the studio, behave. His last day was a study in contrasts: smiles stretched wide, jokes landed with perfect comedic timing, and yet, behind the laughter, there was that unmistakable weight of farewell. The final group hug lasted just a second too long. Then, with a grin and a wave, he was off, leaving behind a timeline full of memories (and at least three unfinished projects that now haunt us).

Mithun's GPU gymnastics go on!

Meanwhile, in the Digit test lab, Mithun had entered a battle of his own – not with software bugs or benchmarking woes, but with gravity itself. Testing Nvidia's beefy aftermarket 50-series GPUs turned into a structural

engineering challenge. These cards weren't just powerful; they were massive. He tried everything: makeshift support brackets, creative use of zip ties, even balancing them on sheer willpower. But the pièce de résistance? A precarious stack of old hard drives repurposed as anti-sag supports. Somewhere, a past self from the SATA era wept, but hey, physics bowed to ingenuity. The setup held – at least until someone sneezed too close to the test bench.

While Samsung's S25 fanfare had us all buzzing...

While Samsung's S25 fanfare had us all buzzing, Mustafa made his triumphant return to the Digit English team, camera-ready and review units stacked like trophies. Meanwhile, Ayushi's birthday bash became the office lifeline we didn't know we needed, trading benchmarking tools for birthday cake as the team collectively remembered that socializing without discussing refresh rates is technically possible. And in the adventure department, Manas jetted off to Yokohama, becoming our envoy to Lenovo's 2025 premium laptop showcase. His WhatsApp updates featuring the sleek Yoga Slim 7i and ThinkPads had us simultaneously jealous and demanding more photos. The office betting pool on whether he'd return with a Japanese keyboard souvenir remains active at press time. **d**
