

MENTORING NEXT-GENERATION OF TECH ACHIEVERS

KALAVATHI GV, SIEMENS HEALTHINEERS

Mentorship, skill development, and cross-generational learning are key to nurturing India's next wave of tech talent. I truly believe that structured mentorship programs and reverse mentoring are both essential. These not only help connect young professionals with industry experts, but it also creates a two-way learning culture on topics related to tech and allied fields. We invest heavily in developing technical expertise, domain knowledge, and soft skills among the next generation of talent within our organization.

ARCHANA BAJAJ, PEGASYSTEMS

Today's tech-savvy talent is well-versed in emerging trends, but the real challenge lies in integrating their ideas into the company's vision while fostering adaptability and a strategic mindset. Through mentorship, I provide diverse perspectives and create opportunities for them to showcase their best ideas to leadership. By fostering this culture of innovation, we empower the next generation to drive meaningful change.

ANITA KAPOOR, LENOVO INDIA

Our legal team offers internship opportunities to students and fresh graduates, and our philanthropy programs focus on innovation labs and STEM education. Through initiatives like the Innovators of Tomorrow Program in partnership with Muskaan Dreams, we're equipping government school students in Lucknow with essential 21st-century skills like coding, AI, and digital literacy.

KRITHIKA BHAT, PURE STORAGE

In India, we're building a growing organization where the teams have equal opportunities to take on key roles and projects, just like their counterparts in the US and Prague. We're focused on empowering the India teams to operate independently, reducing their reliance on counterparts in other locations. Success is measured by the successful execution and outcomes of these initiatives. It's been especially rewarding to see the tech talent in India showcase their creativity and innovation.

JAYA VAIDHYATHAN, BCT DIGITAL

Overcoming gender disparity in the technology space is something I believe needs to be addressed systematically, one step at a time. Personally, I've always been committed to creating an environment where everyone, regardless of gender, has equal opportunities to succeed. This starts with fostering a culture of inclusion where women are empowered to take on leadership roles and are encouraged to contribute to all levels of decision-making.
