

it has none of the RGB madness that partner cards tend to have. So the idle power draw goes down to 7-8 Watts when the fans are inactive. However, when under load, the total power draw can easily hit the 250 W max limit. With mid-tier cards, NVIDIA seems to hard lock the power draw to the maximum advertised limits. This is great for the average consumer since they're unlikely to be surprised by runaway power bills. However, for the folks who like to overclock and tinker, having a hard power limit is an absolute downer. This means that even if the GPU had the potential to give more performance, the hard power limit will eliminate all that potential.

One good thing about the RTX 5070 is that the power connector provided with the graphics card has a hard and chunky grip for users to properly attach the connector onto the graphics card. NVIDIA has been getting some flak for their 12VHPWR connector that has not been mating properly. With this change, hopefully, we'll see fewer instances of burnt connectors.

OVERCLOCKING THE NVIDIA RTX 5070

Despite the fact that the power limits

have been hard-locked, the RTX 5070 still has a decent amount of headroom for overclocking. We were able to extract about 7.65 per cent more performance from the RTX 5070 with a few simple tweaks to the memory and core clocks. While this was primarily done on a synthetic benchmark, the impact might not be as profound when you consider real-world gaming.

VERDICT

The NVIDIA RTX 5070 is a decent upgrade for folks coming in from 2-3 generations back. With an MSRP of INR 60,000, the NVIDIA RTX 5070 is a great buy for folks who might be on an RTX 2070 or 2080 and to a certain extent, even the folks who're currently running an RTX 3080. Just the additional frames produced by DLSS 4 Multi Frame Generation is enough to make this a great card for folks who are into casual gaming and even those into eSports. From a purely raster performance perspective, we're still looking at incremental performance. And if the partner cards are nowhere near MSRP then NVIDIA will have a tough time selling the RTX 5070 and the 5070 Ti, especially considering the recent announcement by AMD for the RX 9070 XT and RX 9070.
