

be the most powerful, offering 8GB of VRAM and higher power limits, which explains why it consistently tops performance charts. For example, in the 3DMark TimeSpy benchmark, the Lenovo scores 9,348, approximately 63% higher than the ASUS TUF Gaming F16's score of 5,727. The Gigabyte G6X, powered by the RTX 4050, also outperforms the ASUS, achieving a score of 8,813, roughly 54% higher.

This performance difference boils down to raw GPU power and memory bandwidth. The RTX 3050 in the ASUS is an older Ampere-based chip with only 4GB of VRAM and a lower 65W TGP, which limits its ability to handle newer, more demanding games, especially at high settings. On the other hand, both the RTX 4050 and 4060 offer much better future-proofing, especially for users aiming for 1080p gaming at high or ultra settings. In synthetic workloads like TimeSpy Extreme and FireStrike Ultra, these gaps only widen, further highlighting how dated the RTX 3050 now feels in 2025. While the ASUS TUF Gaming F16 may still handle casual gaming or esports titles well, it clearly lags behind when compared to laptops equipped with newer-generation GPUs like the 4050 and 4060.

When comparing CPU performance across the Lenovo LOQ 15IRH8,

Gigabyte G6X, and ASUS TUF Gaming F16, the Gigabyte G6X clearly comes out on top in both Cinebench R23 and Geekbench 6 tests. In Cinebench R23, which measures CPU rendering performance, Gigabyte leads with 1863 points in single-thread and 14,504 in multi-thread performance—showing strong capabilities for both everyday tasks and multi-core workloads like video editing or 3D rendering. Interestingly, the ASUS TUF Gaming F16 holds its own in single-thread performance, scoring 1736, which is slightly ahead of Lenovo's 1546. This means that for light tasks such as browsing, word processing, or navigating the OS, the ASUS may actually feel snappier than the Lenovo.

However, when it comes to multi-threaded performance, which matters for heavy multitasking or demanding applications, the ASUS falls behind with 11,364, compared to Lenovo's 12,740 and Gigabyte's leading score. Geekbench 6 paints a similar picture—Gigabyte dominates with a single-core score of 2560 and multi-core score of 13,478. ASUS again scores well in single-core (2315), beating Lenovo (2025), but trails significantly in multi-core workloads with a score of 7684, which suggests limitations in tasks that use all available CPU cores.

At 1080p High settings, the ASUS TUF Gaming F16 lags significantly behind the Lenovo LOQ 15IRH8 and Gigabyte G6X in gaming performance, largely due to its weaker RTX 3050 GPU. In demanding titles like Assassin's Creed Valhalla and Metro Exodus, ASUS struggles with just 39 and 53.8 FPS respectively, while Lenovo and Gigabyte comfortably push past 90 FPS. Even in older or more optimised games like Shadow of the Tomb Raider and Gears 5, ASUS remains 30–50% behind. If you're aiming for smooth high-settings gameplay in 2025, the ASUS falls short, while Lenovo and Gigabyte offer a much more capable experience.

VERDICT

In conclusion, the ASUS TUF Gaming F16 (2025) stands out with its sturdy design, immersive display, and decent single-core performance, making it a reliable option for casual gamers and everyday users. However, it clearly falls behind competitors like the Lenovo LOQ 15IRH8 and Gigabyte G6X in both CPU multi-threaded tasks and GPU-intensive gaming, primarily due to its dated RTX 3050 GPU and DDR4 memory. While it holds up for lighter workloads and esports titles, those seeking high-performance gaming or future-proof specs will find better value in similarly priced alternatives equipped with newer-generation hardware.
