

Motorola Edge 60 Fusion

Looks Flagship, Feels Flagship, But There's a Catch

The Motorola Edge 60 Fusion is Motorola's first phone launch of 2025. The

successor to last year's Edge 50 Fusion, which was one of the highest-selling Edge-series phones, Motorola is looking to one-up that success with the Edge 60 Fusion, which has a lot going for itself. It stands out with its distinctive OLED display that curves on all sides, flush with a vegan leather finish on the back that gives it a premium feel.

Priced at ₹22,999, this successor to the Edge 50 Fusion brings several notable upgrades, including a higher resolution 1.5K display, improved Gorilla Glass 7i protection, and a larger 5500mAh battery. I spent a week with the Edge 60 Fusion, and I think it is a phone suited to most users, but not without its caveats.

₹22,999

DESIGN & BUILD

The Edge 60 Fusion's curved design really feels good in the hand. We get over 96% screen-to-body ratio, which is impressive, and at 180 grams and 8.2 mm thickness, the phone feels substantial but not at all bulky. On the contrary, due to the quad curved panel, the phone feels quite lightweight and comfortable.

We get faux vegan leather finishes in three Pantone colours: Slipstream, Amazonite and Zephyr. I like the Amazonite colour more since it has a canvas-like texture, which feels quite different in the hand than the Zephyr variant.

This design gives it a distinct premium feel, and it's a refreshing departure from the endless sea of glass-backed phones. That being said, the frame of the phone is plastic, but the

build quality is solid, and you get an IP68/69 dust & water resistance rating.

One thing I noticed is that the Edge 60 Fusion arrives without a protective case in the box. When I reached out to Motorola about this curious omission, they explained it was a cost-cutting measure, claiming there's enough third-party support for cases and skins these days.

While I understand the business point of view, my recommendation to them was to make their first-party cases available for purchase separately. Their official cases typically offer better fit and finish, and many users prefer matching their phone with branded accessories.

DISPLAY

The centrepiece here is the 6.67-inch

quad-curved pOLED display, which is just excellent. It immediately stands out as soon as you take it out of the box, and with a 1.5K resolution, everything, be it text or videos, looks sharp and vivid.

The 120Hz refresh rate keeps everything smooth, though I should note this is a downgrade from the 144Hz refresh rate that you often get to see on Moto phones. The reason for that, Motorola says, is that they got feedback where users were getting relatively lower screen-on time and battery backup when the display was set to 144Hz.

In our display tests using Portrait's Calman and C6 Colorimeter, we found out that the Edge 60's display is perfectly colour calibrated with an Average Delta E of 1 and 100% sRGB and DCI-P3 coverage, meaning it's as good as it gets whether you're scrolling social media or binging your favorite shows. This display went up to 2400 nits of peak brightness in the Adaptive mode, which is respectable for outdoor visibility.

In comparison with the Edge 50 Fusion, the display resolution has been bumped up to 1.5K from FHD+, and you get Gorilla Glass 7i screen protection over Gorilla Glass 5.

PERFORMANCE

The Edge 60 Fusion is powered by the Dimensity 7400 SoC, which is paired with 8 or 12GB of LPDDR4X RAM and 256GB UFS 2.2 storage. Bonus points to Moto for making the default storage 256GB, and while UFS 2.2 isn't the fastest standard available, it is sufficient for most users. There's also microSD expansion up to 1TB, which is becoming rare in mid-range smartphones.

In benchmarks, the Edge 60 Fusion lives up to its potential with a 20% uptick in AnTuTu and a 27% increase in graphics performance in comparison to the Edge 50 Fusion. In the CPU throttling test, the phone showed minimal signs of throttling, which is decent, but as per our test labs, the Edge 50 Fusion performed around 10% better in this particular test.

In my daily use, I did not face any stutters or lags while opening or
