The INNO3D GeForce RTX 5070 Ti X3 OC

graphics card presents a well-considered balance of robust materials, practical dimensions, and reliable cooling solutions. While it may not deviate sharply from the standard dimensions of premium graphics cards, it is moderately elongated, measuring roughly 300 mm in length, 116 mm in height, and occupying 2 slots in thickness. This sizing makes it compatible with a wide range of mid- to full-tower cases, though prospective owners should always double-check clearances before purchase.

One of the standout elements of this card's construction is its sturdy shroud, fashioned from a combination of metal and reinforced plastic. This approach ensures that the heatsink is well protected without imposing an undue weight penalty. There is a subtly brushed finish on the shroud, lending the card a sleek and understated appeal that should blend in seamlessly with most system builds.

Underneath, the card employs a triple-fan configuration, each fan measuring roughly 90 mm. They are arranged in a line along the aluminium fin stack, ensuring uniform airflow across the entire length of the heatsink. All three fans are spin in the same direction unlike some of the newer designs we've seen recently wherein the middle fan spins in the opposite direction as opposed to the fans at the extremities. The heatsink itself features a dense arrangement of stacked fins and multiple copper heat pipes that make direct contact with the GPU core, transferring heat efficiently for stable operation under demanding loads.

The PCB underneath has a clean layout, with carefully positioned components and a robust power delivery system befitting a factory-overclocked model. INNO3D has opted for a 16-pin power connector (often referred to as the 12VHPWR connector in NVIDIA's newer line-ups), ensuring that the card

can draw sufficient power without cluttering the design with multiple cables. The older PCIe connectors would have been preferred on higher wattage cards since the 12VHPWR connectors to burn quite often.

Connectivity is handled by a typical selection of ports, comprising three DisplayPort 2.x outputs and one HDMI 2.1 port. Collectively, the build quality of the INNO3D GeForce RTX 5070 Ti X3 OC is respectable, offering a reassuring combination of durable materials, a well-thought-out cooling setup, and a refined aesthetic that should suit a variety of system builds.

NVIDIA GEFORCE RTX 5070 TI SPECIFICATIONS

The NVIDIA GeForce RTX 5070 Ti has most of the same specifications as the RTX 5080, but is slightly reduced. It features six GPCs (Graphics Processing Clusters), one less than the RTX 5080. There are 35 TPCs (Texture Processing Clusters) within the six GPCs, and then there are 70 SMs (Streaming Multi-processors) with a total of 8960 CUDA Cores. Compared to the RTX 5080, that is approximately 17% fewer CUDA cores, therefore, we should see a similar difference in synthetic benchmarks. However, real-world gaming performance depends on optimizations, as it always has.

Even the clock speeds are comparable, with a base clock of 2300 MHz and a boosted clock of 2452 MHz. The memory clock speed has been reduced to 1750 MT/s, resulting in a significant performance drop compared to the RTX 5080. In terms of memory capacity, we have the same 16 GB of GDDR7 memory connected to a 256-bit memory bus. The overall memory bandwidth is 896 GB/s, which is somewhat lower. Furthermore, the net power consumption appears to be limited to 300 Watts.

The INNO3D GeForce RTX 5070 Ti X3 OC that we have has a base clock of 2295 MHz and a boost clock of up to 2482 MHz, giving it a slight advantage over the reference specifications. Furthermore, it has the same configuration as the MSI 5070 Ti that we previously tested.
