

NVIDIA GEFORCE RTX 5070 Ti PERFORMANCE

The INNO3D RTX 5070 Ti delivers strong performance across synthetic benchmarks and gaming workloads, making it a capable option for high-refresh-rate 1440p gaming and respectable 4K experiences. In synthetic tests, it achieves a Time Spy Graphics Score of more than 28K and a Fire Strike Graphics Score of more than 59K, indicating excellent rasterisation performance. In more demanding tests such as Time Spy Extreme and Fire Strike Ultra, it maintains competitive scores of 13,672 and 18,077 respectively.

Real-world gaming performance is similarly impressive. Titles like Assassin's Creed Mirage and Baldur's Gate 3 run at 140–167 fps at 1440p, ensuring smooth experiences even in graphically rich environments. At 4K, the card maintains playable framerates, with 90 fps in

Assassin's Creed Mirage and close to 99 fps in Baldur's Gate 3. Heavier titles like Cyberpunk 2077 are more demanding, but still see 60 fps at 4K without ray tracing enabled. In high-refresh titles like DOOM Eternal and The Witcher 3, the card excels, pushing frame rates well beyond 240 fps at 1080p and comfortably exceeding 140 fps at 1440p. Overall, the INNO3D RTX 5070 Ti proves itself to be a capable GPU for enthusiasts aiming for fluid gaming without compromising visual fidelity.

POWER CONSUMPTION AND THERMALS

The INNO3D GeForce RTX 5070 Ti X3 OC Edition graphics card, despite its overclocked configuration, maintains efficiency during idle periods, drawing a mere 22 watts of power. This minimal power usage contributes to lower system temperatures during routine tasks such

as media consumption and general computing. However, under heavy workloads, like demanding games or resource-intensive tasks such as 3D rendering, the power demand increases substantially, peaking at 300 watts.

Throughout our rigorous testing, we pushed the graphics card to its maximum capacity with demanding gameplay scenarios. We were pleased to discover that the temperature remained below 70 degrees Celsius, demonstrating effective thermal management and a robust cooling solution that efficiently dissipates heat, even under heavy load. During idle periods with minimal activity, the graphics card maintained a comfortable temperature of approximately 45 degrees Celsius. This low idle temperature suggests that the card's power management and fan control are optimized for energy efficiency and quiet operation.

VERDICT

The INNO3D GeForce RTX 5070 Ti X3 OC graphics card delivers exceptional performance for its price point, especially for 1440p and 4K gaming, boasting up to 30% faster speeds than its predecessor, the RTX 4070 Ti. Its efficient thermal design ensures cool and quiet operation even under heavy load. While the 12 VHPWR connector might be a concern for some, the card is currently retailing for around INR 98,000-101,000 which is quite bloated and should be ideally around INR 82,000 in India. Market fluctuation are common but 20K above MSRP is a little too much. Overall, the INNO3D GeForce RTX 5070 Ti X3 OC, particularly the compact SFF-Ready model, is an excellent option for gamers seeking high performance. All it needs is a reasonable price tag.
