

■ **BETTER AADHAAR**

New Aadhaar app with Face ID and QR code unveiled

Union Minister Ashwini Vaishnaw has unveiled a new mobile application for Aadhaar that will integrate facial recognition and AI-powered authentication. The application has been developed with the Unique Identification Authority of India (UIDAI) and aims to make Aadhaar verification as seamless and secure as using UPI for payments. The new Aadhaar app eliminates the need to carry physical copies of your Aadhaar card for verification at hotels, shops, airports, and other locations. Citizens will be able to verify their identities using QR scans and real-time face authentication, all from their mobile phones. tinyurl.com/3ah5zpxu

■ **CHATGPT UPDATE**

ChatGPT can now remember past conversations

OpenAI has just announced a new update to ChatGPT that makes the AI chatbot more helpful than ever, as ChatGPT can now remember all of your past conversations to give

you more personalised responses. This means it can better understand your preferences, interests and style, making it more useful for things like writing, getting advice and more.

Earlier, ChatGPT's memory only saved a few specific details you chose to share. But with this update, it can automatically use your past chats to make future conversations feel more tailored to you. Importantly, OpenAI says you're still in control of what ChatGPT remembers. If you don't want it to use your past chats, you can easily turn off this feature in the settings. In fact, if you've already opted out of memory, this new feature will also be off by default, claims OpenAI. tinyurl.com/3echpnm9

iOS 19 to be Apple's biggest update with AI focus

Apple intends to introduce iOS 19 at WWDC 2025. It could be the company's largest software update. After more than a decade, Apple is planning to release transformational updates that will change how you use the iPhone.
