

Lumio Vision 9 Mini LED TV

Provides Excellent Value

₹59,990

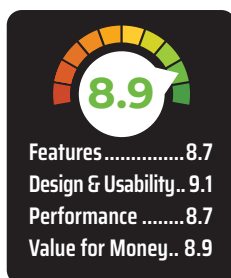

Lumio is a promising new TV brand made

by people who are passionate about audio-video tech. These are basically ex-Xiaomi and Flipkart employees who have extensive experience with building TVs and also marketing them.

Their debut flagship, the Lumio Vision 9, is positioned as their best—and it certainly doesn't hold back on bold claims viz. 900 nits of peak brightness, exceptional colour accuracy, and over 80% coverage of BT.2020 colour space. Let's put these claims to the test.

PERFORMANCE CLAIMS

The Lumio Vision 9 mini LED TV claims to be the fastest TV in India, or rather fastest TV under ₹1,00,000 in India. Lumio uses a BOSS processor for the TV, which they claim is a flagship processor. The company doesn't specify the actual processor name, though. We dug a little deeper into the software

and noticed that they are using a Realtek RTD2885M processor.

The Vision 9 is a pretty snappy TV, nonetheless. We tested its speed next to the Bravia 3, which is pricier but a good comparison model to give you an estimation of the actual performance.

As you can see in the video review above, the Vision 9 boots significantly faster. Vision 9 is also faster when it comes to opening apps for the first time. Scrolling also feels slightly smoother on the Lumio Vision 9. Even the Wi-Fi speeds are fast, and our content switched to high resolution almost instantly.

So, yes, Vision 9 is indeed faster than TVs priced under 1 lakh that we have tested in India. Lumio has a lot of headroom with 3GB RAM and 32GB storage, so we are optimistic that the performance won't degrade over time.

DISPLAY PANEL

Coming to the display, Lumio has sourced a really good quality IPS-

level panel. You get a BT2020 colour coverage of 82%, which is really high in this segment. The only other two TVs that we have tested that cover more than 80% BT2020 coverage are the Sony Bravia 9 and the Samsung S95D with a QD-OLED panel. Not only the colour gamut but even the BT2020 colour volume stands at 73%, which is really impressive.

In the movie mode, we recorded 98% DCI-P3 coverage and 100% sRGB coverage. The bottom line is that this panel is capable of reproducing all the colours conventionally used in SDR and HDR content.

The display can also get really bright. We recorded a peak luminance of 924 nits on a 25% window - even in the colour-accurate Movie preset - and that's impressive.

The use of an IPS LCD panel means you get wide viewing angles but the native panel contrast is 1250:1, which is lower than what you'd usually get with VA panels.

Of course, with local dimming enabled and some adjustments to the gamma curve, the contrast is increased. The TV has 160 local dimming zones, which is on the lower side but as we often preach, dimming performance has a lot more to do than just the dimming zones.

SDR AND HDR PERFORMANCE

So, has Lumio managed to make the most of this good-quality display panel? Let's find out.

One thing that you don't get on most affordable and mid-range TVs - the colour-accurate Movie preset is thoughtfully tuned, which gives us hope that more people will be open to using it in spite of the warm but relatively accurate tones.

While playing content, it's quite clear this is a bright panel, and Lumio isn't shy about showing it off. The TV is set for 100% brightness even in SDR. The skin tones seem to have a touch more colour than standard. Other critical memory colours are represented accurately.
