

Vivo V50e 5G

Sharp camera, eye-catching design, but is that enough?

₹28,999

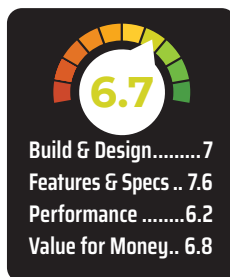

The mid-range smartphone market in India is more competitive than ever, with brands constantly trying to outdo each other by offering premium features at accessible prices. From vibrant displays to powerful cameras and fast charging, users now expect a lot without having to spend a fortune.

Well, Vivo has just launched a new contender in this space—the Vivo V50e 5G— which is priced at Rs 28,999. With its eye-catching design, the phone looks well-equipped to take on the competition. But does it live up to expectations in real-world use? I spent a good amount of time with the device to find out how it performs across key areas like design, display, performance, camera, and battery. Here's my full review of the Vivo V50e 5G.

VIVO V50E 5G: DESIGN

There are two colours of Vivo V50e 5G

smartphone—Sapphire Blue and Pearl White. I got the Sapphire Blue for the review. The first thing that stood out to me was the phone's shimmer finish. The back has a flowing wave-like pattern that adds to the visual appeal. The back panel does attract fingerprints, but they aren't easily noticeable.

Now, talking about the design language, I think Vivo has really nailed the look without going overboard—and here's why:

To start with, the dual-ring camera setup on the back stands out with its bold and modern design. Two camera sensors are vertically aligned within a circular module, and just beneath it sits the company's iconic Aura Light.

Second, the back panel is plastic, but it doesn't feel cheap at all. The glossy acrylic-like finish gives it a near-glass look, and the curves along the edges make it comfortable to hold. Overall, the Vivo V50e is stylish,

comfortable in the hand, and has an eye-catching design.

VIVO V50E 5G: DISPLAY

The Vivo V50e features a 6.77-inch AMOLED display with a 120Hz refresh rate. It delivers that signature AMOLED punch with rich, vibrant colours that really stand out.

In our display tests using Calman and the Spectral C6 Colorimeter, the V50e's screen reached an impressive peak brightness of 2320 nits in auto mode, making it capable of handling bright outdoor conditions with ease and ensuring sunlight legibility.

In terms of colour accuracy, the Vivo V50e performs just as well. It recorded an average Delta E of 1.5 in the Professional colour profile, which means the colours look accurate and vibrant. The V50e is ideal for watching YouTube videos, movies and shows on OTT platforms. The display also covers 93.3% of the sRGB colour gamut and maintains a good balance of blue, red, and green tones.

VIVO V50E 5G: PERFORMANCE

Let's talk about performance—and I'll be honest, this is one area where I have mixed feelings. One of the things that disappointed me a bit is the processor. The Vivo V50e equips the same Mediatek Dimensity 7300 chipset that we saw in its predecessor Vivo V40e. I was hoping Vivo would upgrade the chip this time, especially considering the competition in this price range.

That said, in real-world usage, the phone actually performs quite well. I didn't feel any lag while doing day-to-day stuff like texting, scrolling social media, watching videos, or switching between apps.

When it comes to gaming, casual titles like Temple Run ran smoothly without any issues. But if you're someone who likes to play graphic-heavy games like BGMI, you might want to keep your expectations in check. Even at balanced settings, I faced constant frame drops.

Well, this was all my personal experience. Now, let's talk numbers. The Vivo V50e scored 6,83,637 on AnTuTu, 1,029
