

Sony Bravia 3 65-Inch TV

A great TV to watch out for this festival season?

₹96,990

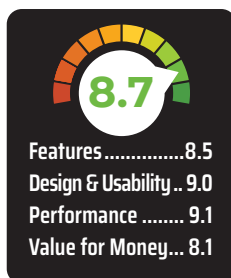

Sony has had a wonderful year with TVs. The premium TVs from the brand, which include the Bravia 8 OLED, and Bravia 7 and 9 Mini LED, were all quite impressive, but all of these also fall in the premium segment. So, yes, we were very eager to test the Bravia 3, which is more accessible in the mid-range and should be available as a great deal this festival season.

In our Sony Bravia 3 review, we will scrutinise all aspects of the TV and put it through the wringer - just to help you decide if this is a great buy or not.

DISPLAY PANEL QUALITY

Our review sample employs a good-quality 65-inch VA LCD panel with a native contrast of 4402:1, but the 55-inch model may have an IPS LCD panel with shallower blacks. The frame-dimming technology worked better than expected and helped elevate the experience in dark scenes.

We're also pleased that the colour-accurate Professional Mode is included

for purists who prioritise high colour accuracy and a warm white point close to the industry-standard D65. Gamut's coverage is also impressive. The panel can reproduce almost 100% of Rec. 709 colour space and colour volume used for SDR content. As for HDR, the Bravia 3 supports 94% DCI-P3 coverage and 69% BT2020 coverage in UV terms, which is better than what you'd get with most QLED TVs in the budget.

On a 10% Window, the Bravia 3 can get around 410 nits bright. This is relatively less than what you'd expect from TVs in this budget and also limits the HDR impact. This also limits colour volume in HDR, which is to say that Bravia 3 will struggle to depict bright and highlight saturated colours that you'd occasionally run into with HDR content.

The panel on the Bravia 3 is not overly reflective. Also, the VA panel used here doesn't mean that you'd have to compromise much on viewing angles. We did notice a very slight loss of luminance off-axis, but this is within the

bounds of what is perfectly acceptable, so no big concerns here.

SDR AND HDR PERFORMANCE

We tested the colour accuracy of the display using Spectralcal C6 HDR2000 Colourimeter, Videoforge Pro pattern generator, and Calman Ultimate software. The professional mode is the most accurate preset.

Unlike higher-end Bravia models, calibrated modes for different apps have not made the cut, which is understandable since the hardware might not have done them justice.

The colour accuracy is excellent on Bravia 3. In SDR, we recorded an average delta error of just 2.3 and a maximum delta error of 5.4 out of the box in the professional mode. The accuracy is also great in the Cinema mode. Those who prefer vivid or boosted colours would prefer to use the TV in Vivid or Standard mode.

In SDR, Skin tones and other critical memory colours are rendered accurately. The TV also does a great job with grey-scale details and can map luminance in dark and bright scenes masterfully - which is something tough to find on mid-range TVs.

In HDR, we recorded an average delta error of 2.4 and a maximum delta error of 4.8 which is excellent. The TV supports Dolby Vision and HDR10.

As mentioned above, due to limited peak brightness bright HDR scenes lack that HDR pop as you'd get on Bravia 7 or other mid-range QLED TVs with brighter panels.

HDR content with mixed APL or sequences that are not very bright and sequences that are dark are handled nicely. This dark hallway in *Severance*, for instance, is not easy to get right for most TVs.

Motion smoothing is enabled by Default in Dolby Vision as well as in Standard and Vivid picture modes. To avoid the soap opera effect without jittery motion, you can go to Motion-Flow settings (under Advanced Picture Settings) and select Smoothness as 1 in Custom preset. Bravia 3 also did a great
