

Formovie Theater Premium UST Laser Projector

A True Home Cinema Experience

₹4,75,000

It's not often that you get to experience a home entertainment technology that completely reshapes your perspective on how you watch films and shows. But after spending a month with the Formovie Theater Premium ultra-short-throw (UST) projector in my living room, I've gone from being firmly attached to my 55-inch OLED TV to a convert who now can't imagine going back. The Formovie UST projector doesn't just deliver a large screen; it offers a true cinema-grade experience, and if you've ever dreamed of bringing the big screen into your home, the Formovie Theater Premium might just convince you to take the plunge.

DESIGN & BUILD QUALITY

I was initially intimidated when a massive flight case landed at my doorstep. Since Formovie sent the Theater Premium via Aytexcel, its official distributor for India, I received it in a projector case, but if you buy the retail unit, you won't get it in a flight case.

The Formovie Theater Premium maintains a similar industrial design

to its predecessor. At 9.8kg, it's a substantial piece of equipment that feels premium the moment you lift it out from its packaging. The black metal casing feels more refined than its predecessor, with a matte finish that blends into a darkened home theater environment.

The fabric mesh across the front houses the Bowers & Wilkins speaker system. The rear maintains a practical array of connections, including three HDMI 2.1 ports (one with eARC), two USB 2.0 Type-A ports, an RJ45 LAN port, and optical audio output.

What I particularly appreciate about the physical design is the inclusion of height-adjustable feet, which made precise alignment much easier during setup. In addition, the built-in power supply means you're only dealing with a single power cord rather than a bulky external brick that would have otherwise made your media console look cluttered.

SETUP AND PLACEMENT

Setting up an ultra-short-throw projector can be notoriously finicky, but with the Theater Premium's 0.21:1

throw ratio, I was able to achieve a 100-inch image with just 16-17cm of distance between the projector and my living room wall.

The automatic electric focus worked well, and the eight-point keystone correction allowed me to fine-tune the image alignment, even though my wall wasn't perfectly flat. However, given its price, I would have loved to skip the hassle if there had been an optical sensor for automatic keystone adjustment.

IMAGE QUALITY

The Theater Premium's triple-laser ALPD (Advanced Laser Phosphor Display) 4.0 system creates a colour experience that's difficult to describe without sounding hyperbolic. Colours don't just look accurate, they look true to life. The slightly enhanced saturation gives content a visual punch that most viewers will appreciate, creating a more immersive viewing experience.

I'll never forget the first time I fired up *Dune: Part Two* on the Theater Premium, as the sweeping desert landscapes spread across the wall of my living room. The combination of the massive 120-inch image, the impressive 2,200 lumens of claimed brightness, and a 3,000:1 contrast ratio created a viewing experience that genuinely rivalled my local cinema.

Watching the sandworms emerge from beneath the desert surface, I felt a visceral thrill that my TV had never managed to evoke. It just looked as expansive as when I watched it in a theater. The depth and dimensionality of the image were striking. Dark scenes revealed details that I'd otherwise miss in theatrical viewings, while bright scenes looked true to life without looking washed out.

The optical system has been redesigned, resulting in significantly better edge-to-edge sharpness, maintaining excellent detail across the entire projection. This improvement is particularly noticeable with fine text or detailed landscapes in 4K content.

While the Formovie Theater Premium claims 107% coverage of
