

LEGION SLIM 5 16

HOW GOOD IS THE GAMING PERFORMANCE?

Lenovo's latest iteration of the Legion Slim 5 might carry the word "slim" in its branding, but this machine isn't exactly trying to win a fashion contest. With a weight of around 2.3 kilograms and a thickness ranging from 19.9mm at its thinnest to 21.9mm at its thickest, the Legion Slim 5 is more of a performance-first laptop that happens to be "slimmer" than a typical gaming notebook – not ultra-portable.

Under the hood, this model packs AMD's new Ryzen 7 8845HS processor, part of the Hawk Point Zen 4 family, delivering solid multithreaded muscle for both gaming and productivity. The chip also comes with Radeon 780M integrated graphics, but the real firepower comes from the dedicated NVIDIA RTX 4060 GPU with 8GB GDDR6 VRAM running at a 140W TGP.

The laptop ships with a single stick of 16GB DDR5 memory running at 5600MHz – the maximum supported frequency for this CPU. Storage is

equally impressive, thanks to a snappy 1TB PCIe Gen 4 SSD. In our CrystalDiskMark test, it clocked sequential read speeds of up to 7116 MB/s and write speeds around 3793 MB/s, making it well-suited for heavy multitasking, large file transfers, and fast boot times. The keyboard has very minimal flex, and the overall chassis feels well put together. The hinge mechanism allows for smooth movement and opens flat up to 180°, which is a familiar Lenovo touch appreciated by many.

Where the Legion Slim 5 shines brighter than its predecessor is in its connectivity layout. On the left side, you get two USB-C ports – one of which supports DisplayPort 1.4 and up to 140W PD charging – alongside a 3.5mm headphone jack. On the right, there's a full-sized SD card reader and a physical webcam shutter. Around the back, you'll find two USB-A 3.2 Gen 2 ports (one of them with always-on

charging), an HDMI 2.1 port capable of 8K@60Hz output, an RJ45 Ethernet jack, and a power connector. The layout makes this laptop equally fit for creators, gamers, and power users who depend on versatile IO.

Internally, the upgradeability is straightforward. One RAM slot is populated and covered with a metal

shield, while the other slot is open for upgrades. The SSD slot is easy to access and replace. Interestingly, the Wi-Fi card is a Realtek Wi-Fi 6E module – not from Intel or MediaTek – but delivers decent real-world speeds.

Battery life is modest, as expected from a gaming device. The 80Wh battery (78.1Wh usable) delivers around 1 hour of gaming and up to 6.5 hours of light use or video playback. That might not sound impressive, but Lenovo tries to compensate with a handy MUX switch that lets you toggle between GPU modes. There are
