

Disrupting India's TV game

CEO Raghu Reddy and Co-founder Sudeep Sahu on taking on big players with Lumio TVs

In a smart TV market long dominated by global giants and flooded with budget contenders, Indian startup Circuit Technologies is betting on a new formula to stand out: speed, longevity, and a user-first design philosophy. The company has just launched its first smart TVs: the Lumio Vision 7 and Lumio Vision 9 that promise to fix the many grievances Indian consumers have had with smart televisions over the past decade.

"When we looked at the smart TV space, one thing was clear: most people were frustrated with how slow their TVs had become," Raghu Reddy, CEO of Circuit Technologies told Times Now Tech in an exclusive conversation, on the sidelines of the launch.

A faster TV

This insight became the core of Circuit Technologies' mission: build a TV that starts fast and stays fast for years. The Lumio Vision series is built on a hardware-software foundation optimised for longevity. "We worked with chipset makers, Google TV, and our

own software teams to create a device that can withstand the wear of time," Reddy explains.

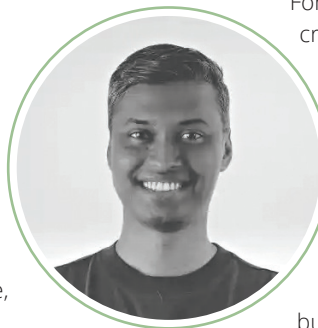

He adds that their goal was to make Apple TV-like responsiveness a native feature, not a paid upgrade. "We want to save customers the cost and hassle of buying an additional streaming device just to fix their TV."

Beyond speed, Reddy emphasises the importance of tuning, especially in audio and display quality. "Every brand boasts buzzwords like Dolby Vision, but the real question is – how well is that implemented?"

The Vision 7 features a premium QLED panel, while the Vision 9 steps up with a Mini LED display, local dimming zones, and superior peak brightness. "These aren't specs for the sake of specs. We wanted people to do a side-by-side comparison with Sony or Samsung, and be surprised," says Reddy.

A window of opportunity

In a market crowded with over 100 TV brands, launching yet another television might seem like an act of bravery or madness. But for Sudeep Sahu,

Sudeep Sahu
Co-founder & Head of Product at Lumio

Co-founder and Head of Product at Lumio, this move is neither impulsive nor ill-informed. What made Sahu and his team confident that this was the right time to launch a TV brand?

"Two reasons," he begins. "A lot of established brands have exited, and the market for smart TVs has pockets of growth – particularly in 4K and Mini LED." He breaks it down with numbers: "70% of TVs shipped in the last year were 4K. That's why we're only doing 4K. And globally, Mini LED TVs are now outselling OLED."

For Lumio, this wasn't about creating a budget-friendly TV, it was about crafting a "mid-premium" experience that delivers high performance without pushing prices into the stratosphere. "We're not chasing first-time buyers," Sahu clarifies. "We're building for consumers who already use smart TVs but are frustrated with their limitations."

The hardware hustle

One of the standout features of Lumio's TVs is the processing power, comparable to what you'd find in televisions that cost upwards of ₹2 lakh. This includes a flagship-grade processor, 3GB RAM and ample storage to give enough headroom for consumers and ensure that performance stays as is in the long run. "All our LED TVs, including the 43-inch Vision 7, come with at least 16GB storage. The Vision 9 Mini LED steps it up with 32GB," he says.

And we agree with Sudeep on this. While display quality is undeniably crucial and often the first thing you notice when watching content, performance plays an equally important role. **d**
