

## SUSE builds India AI strategy around open source

SUSE is positioning open source as a foundation for enterprises seeking greater control over where AI runs, how data is governed and which infrastructure it depends on.

At SUSE Summit Mumbai 2026, the company introduced SUSE AI Factory with Nvidia, combining Nvidia AI Enterprise with SUSE's open source infrastructure and governance framework to support private AI environments. The platform is designed to let enterprises deploy AI workloads in customer-controlled environments while addressing data governance and regulatory requirements.

SUSE's Navigating Digital Resilience 2026 report found that 62% of Indian organisations are actively investing in digital sovereignty, compared with 52% globally. It also found that 90% of Indian IT leaders expect AI budgets to increase, even as organisations face challenges in building secure infrastructure for large-scale deployments.

SUSE is also bringing Linux, Kubernetes, edge computing and multi-cloud management together in a unified infrastructure platform for workloads across on-premises, public-cloud and edge environments, with support for DPDP Act and CERT-In compliance.

"Moving AI from pilot to production isn't about becoming dependent on third-party APIs. Organisations need to own their intelligence, where their models run and how their data is governed," said Rhys Oxenham, vice president and general manager of AI at SUSE.

### MeitY, MEA drive global rollout of India's DPI

A senior official from India's Ministry of External Affairs (MEA) has confirmed that 25 nations are currently running pilot programmes to adopt components of India's Digital Public Infrastructure (DPI) stack, with several countries considering full implementation within the year. Early international pilot initiatives and interoperability arrangements include France Connect, Singapore's National Digital Identity (SingPass), the Oman National Payments Systems, and the Australian Government's Digital ID System (AGDIS).

This global expansion stems directly from the diplomatic momentum established during India's G20 Presidency in September 2023. That summit achieved an international consensus on a common definition for DPI, established a voluntary deployment framework, and created the Global Digital Public Infrastructure Repository (GDPIR).

Technology diplomacy, international legal rules, and foreign policy agreements surrounding DPI are managed by the New, Emerging and Strategic Technologies (NEST) division, a specialised wing created within the MEA in 2020. Execution and technical alignment are handled through close co-ordination between the Ministry of Electronics & IT (MeitY) and Indian diplomatic missions abroad.

India's international outreach focuses primarily on supporting Global South nations through open source technology adoption, knowledge sharing, and direct technology transfers. The foundational technology stack being offered covers Unified Payments Interface (UPI), Aadhaar-enabled Payment System (AePS), DigiLocker, Bharat Bill Payment System (BBPS), FASTag and DigiYatra.
