Gaming & Entertainment: The Next Level

At COMPUTEX 2025, gaming and entertainment took centre stage as brands unveiled a new generation of hardware designed to push the boundaries of immersion and performance. The convergence of AI and gaming was a recurring theme, with companies leveraging machine learning to create smarter, more responsive experiences for players.

Gaming PCs & Handhelds:

GIGABYTE, Acer, and MSI led the charge with their latest gaming rigs and handheld devices. GIGABYTE's lineup introduced new gaming laptops and desktops powered by the latest NVIDIA GPUs and Intel as well as AMD

CPUs, optimized for both traditional gaming and AI-enhanced experiences. The new AORUS Master 18 and Master 16 laptops targeted gamers and creators, offering features like 18-inch mini-LED or OLED displays, Intel Core 9275HX processors, Nvidia GeForce RTX 5090 GPUs, and up to 128GB RAM. The slim Gaming A16 laptop stood out for its portability.

GIGABYTE also introduced the AORUS RTX 5090 AI BOX, an external GPU (eGPU) with Thunderbolt 5 for boosting laptop gaming and AI performance, and the compact AI TOP ATOM mini-PC for local AI workloads.

Acer's Predator series also made waves, with the Predator Helios 18 gaming laptop featuring an AI-powered cooling system. Acer's Nitro 7 handheld device was another highlight.

MSI's latest offerings included the Claw 2, a handheld gaming PC with an Intel Core Ultra processor and advanced AI features for game optimization and battery management. MSI also showcased its new desktop gaming PCs, designed for enthusiasts who demand top-tier performance for both gaming and content creation.

Monitors & Displays:

Display technology reached new heights at COMPUTEX 2025. ASUS unveiled the ROG Strix Ace, a gaming monitor boasting a blistering 610Hz refresh rate—a world first for consumer displays. This ultra-high refresh rate is designed for competitive esports, offering near-instantaneous response times and smooth visuals.

Acer's Predator X27 X monitor also turned heads, featuring a 4K resolution and a 240Hz refresh rate. The monitor incorporates AI-driven display management, automatically adjusting settings for optimal brightness, contrast, and colour accuracy based on the content being displayed. This technology ensures that gamers and creators always get the best possible visual experience.

Wearables & Mobility:

AI Wearables: Smarter Than Ever

Acer made a strong entry into the AI wearables market with two standout products: the FreeSense Ring and AI TransBuds. The FreeSense Ring is a lightweight titanium smart ring designed for 24/7 biometric tracking, monitoring heart rate, heart rate variability, blood oxygen, and sleep stages. It provides AI-generated wellness insights via a companion app.

The AI TransBuds are compact earbuds that offer real-time, two-way voice translation across 15 major languages. Only one person needs to wear the earbuds for effective translation, making them ideal for travel, business meetings, and multilingual education. They also support live captioning and transcription!

Peripherals: Enhancing the User Experience

Genius introduced its new AI Copilot keyboard and mouse, designed to streamline productivity and gaming. The keyboard features AI-powered predictive typing and customizable macros, while the mouse offers adaptive sensitivity and gesture controls.

Ergonomic chairs and desks with built-in AI assistants were another trend at the show. These products use sensors and machine learning to monitor posture, suggest breaks, and even adjust seating positions for optimal comfort. Smart backup solutions, such as portable SSDs with AI-driven data management, rounded out the peripheral offerings, ensuring that users can protect and organize their digital lives with ease. **d**
