

Siri to be revamped with Apple's own LLM

According to Bloomberg's Mark Gurman, Apple has rethought its entire AI strategy. The company is reportedly betting on a

fresh start, with its AI team in Zurich working on a new Siri architecture based entirely on a large language model (LLM) engine. This means Siri will be more conversational and able to synthesise information in real time. However, according to reports, Apple may use iPhones to train AI on user data through differential policy. <https://tinyurl.com/2jnm4jaj>

Best AI laptops for working professionals

AI can help you in multiple ways to improve your productivity, and when working in a professional environment, using a laptop that comes out of the

box with AI capabilities can be not only useful for your day-to-day tasks but also in meetings and your usual interactions with your computer. We understand that many organizations require vPRO CPUs, so this list consists of vPRO CPUs along with ARM to give you the option for every scenario possible, and you can choose the best machine according to your use case. tinyurl.com/4x2486by

Google Search AI vs Cost To Publishers

Google's move can disrupt the traditional news and digital publishing industry

—By **Manas Tiwari**

Google has finally brought AI to its biggest product – Search. In a move that could further disrupt the traditional news and digital publishing industry, Google has rolled out AI Mode, its most advanced AI-powered search experience to date.

Unveiled for users in the US without the need for sign-up, the feature is built to provide an end-to-end answer generation process that aims to eliminate the need to click on external websites. For news publishers, that vision spells another challenge in an already uphill battle for visibility and monetisation.

The new AI mode succeeds last year's Google Overviews, but takes it several steps further. It uses what Google calls a "query fan-out technique" to break down complex questions into sub-queries, scouring the web with multiple simultaneous searches. The result is a concise, highly-contextual, AI-generated answer backed by deeper reasoning and multimodal

capabilities. Google says that this whole experience will be powered by a custom version of Google's Gemini 2.5, the company's most advanced language model to date.

You may look at Google's AI mode demo at its annual developer conference and think of it like a user-friendly innovation. I mean ask a complicated

There are many executives who had come out in the past and highlighted how the click-through rate on their articles from Google Search had dropped since the rollout of Overviews. Similar concerns were also raised for the AI mode, even before its launch.

At the heart of AI Mode is its Deep Search feature – a tool designed

for those who need extensive information but don't want to do the legwork. Deep Search can perform hundreds of queries in minutes, cross-reference disparate sources, and return a cited, near-academic level report. While it may link back to sources, the likelihood of users clicking through diminishes when they already feel they have a complete answer.

Moreover, the rollout of AI Mode as a prominent new tab in Google Search and the mobile app marks a clear push toward normalising this AI-first search experience. What was once an experimental Labs feature is now entering the mainstream, and potentially redefining how the internet is navigated. **d**

question, and within seconds, Google hands over an expertly distilled, fully cited answer. But for publishers, both small and big, this is their biggest fear coming true. It reveals a reality where publishers may no longer be the destination, but merely the raw material.
