

Motorola Edge 60 Pro

Ambition Wears a Vegan Leather Jacket

After using the Motorola Edge 60 Pro for a month, I know one thing for sure, it doesn't want to fit in. And in a world of midrange phones doing the bare minimum to earn their Rs 30,000 price tag, that's refreshing. It's almost rebellious and I respect that. It's not trying to be the best gaming phone, the best camera phone or the best value-for-money phone. This isn't a phone that plays it safe, it's trying to be different. Which is great, but does that mean it's getting everything right? Find out.

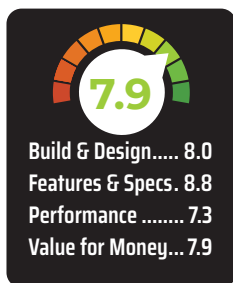

DESIGN

The Edge 60 Pro feels like it came from a team that still believes phones can have character. The edges taper on both sides and depending on what colour you pick, you either get a textured fabric back (Dazzling Blue) or a soft-touch vegan leather (Sparkling Grape) that makes it feel more boutique than budget. Bonus: they don't collect fingerprints like your phone collects useless screenshots.

But then you can't drive your attention away from the plastic frame. It's subtle, but it's there, and look, I'm not a "metal or nothing" purist, but when you hold something that looks this premium, you kind of expect it to feel a certain way. And coming from the Edge 50 Pro's aluminium frame, it is a downgrade. It doesn't affect usage, but it does affect perception. Which, in tech, kind of is usage.

Still, Motorola's pulled off something rare: IP68 and IP69 ratings, MIL-STD-810H compliance, and Gorilla Glass 7i protection, all while keeping it featherweight at 186g and just 8.2mm thick. It's rugged but not rugged-looking and that's not easy to pull off.

₹29,999

So, it does deserve some bonus points here.

DISPLAY

What the Edge 60 Pro does get very right is the screen. The 6.7-inch P-OLED display is one of the phone's crown jewels. It's crisp (1.5K resolution), colour-accurate

(Delta E -0.9, 100% sRGB), and super punchy for binge-watching. Motorola claims 4,500 nits but we measured a more believable 2,380 nits in real-world scenarios which is decently manageable.

HDR10+ support is present and functional on YouTube, but Netflix doesn't actually support HDR. It's not a dealbreaker, just one of those little irritants that sticks in your mind.

Then there's the refresh rate. It maxes out at 120Hz. Which is fine, until you realise that the older Edge 50 Pro had a 144Hz panel. Why go backwards? So, Motorola told me that they found out their users kept the 144Hz refresh rate enabled at all times which affected

performance and battery efficiency, but still it stings if you're the kind of person who notices those extra frames. That said, for watching content, reading, and scrolling, this display is flagship-grade, no notes here.

PERFORMANCE

The Edge 60 Pro is powered by MediaTek's Dimensity 8350 Extreme, a 4nm SoC that sits comfortably just below flagship territory. This is paired with up to 12GB LPDDR5X RAM and UFS 4.0 storage, and you get a phone that feels fast, multitasks effortlessly, and rarely gets bogged down.

Benchmarks? Let's get nerdy:

- **AnTuTu:** 1,413,802 - just below the iQOO Neo 10R's Snapdragon 8s Gen 3 score (1,527,083), but well ahead of the Nothing 3a Pro.
- **Geekbench 5:** 1394 single-core / 4349 multi-core - respectable, if not chart-topping.
- **PCMark Work 3.0:** 19,616 - which obliterates the Neo 10R (12,544) and Nothing 3a Pro (11,880).
- **3DMark Wild Life:** 2961 - not far off from Neo 10R's 3262, and leagues above the 3a Pro's 1057.

Day-to-day performance is solid, I've got no complaints. Apps open fast, animations are smooth, and Motorola's Hello UI is just what Android should feel like, uncluttered and clean.

But if you're really into gaming, this might not be your guy. It's not a gaming phone and during sustained load, CPU performance dropped to 85% of peak, not as stable as Neo 10R (91%) or the 3a Pro (94%). So if you're planning long Genshin sessions, expect some drops, though temps stay under control.

One choice that really had me raising an eyebrow is USB 2.0 in 2024. On a phone that's otherwise so... forward-thinking. That means no display-out via cable and glacial file transfers if you ever dare to plug this into your PC. I guess Motorola wanted to push their wireless Smart Connect features, but practically, it just ends up limiting the phone's potential for anyone who wants to use it like a mini workstation.
