e recently reviewed the Lumio Vision 9

Mini LED TV (tinyurl.com/2375699w), which proved to be a promising flagship from a new brand. As many of you requested, we are now done with our Lumio Vision 7 review, which is an even more competitively priced QLED option that promises similar goodness for under ₹40,000. Does it deliver?

Lumio once again uses a good-quality IPS-level panel with wide viewing angles. You get a BT2020 colour coverage of 78% and BT2020 colour volume of 73%, which is really impressive. In the movie mode, we recorded 96% DCI-P3 coverage and 100% sRGB coverage. So, essentially, the display used on the Vision 7 is capable of almost all colours intended for HDR and SDR content.

We recorded a peak brightness of 440 nits in the colour-accurate Movie mode, which is also above average in this segment, though not quite as stun-

ning as what you'd get on the higher-end Vision 9. The native panel contrast stands at 1250:1 – same as what we got for Vision 9, but without a mini LED backlight, this falls a little short of what you'd get with VA panels.

So, our reading is that the Vision 7 uses a similar or the same IPS LCD display as the Vision 9, but without the mini LED backlight.

SDR AND HDR PERFORMANCE

Now, let's talk about display performance. We noticed that the Movie mode did not have an accurate white point of the box. This is a known bug that will be fixed in the upcoming OTA updates. For now, you can use Movie mode with colour temperature set to "Standard" or use the Standard mode with brightness set to 100 – that is, if you also prefer a warm white point close to the Industry standard D65.

The TV has a very tight greyscale response with a delta error of just 1.9, which is to say brightness is mapped

correctly in SDR. As for colour accuracy, we measured a delta error of 5.4 in SDR across our challenging colour checker test, which is not very tight. This is because colours are slightly boosted, even in the colour-accurate mode. This is noticeable in critical memory colours like Skin tones and Shades of green.

Now, if you are not finicky about colours like us, you might perhaps even prefer these oversaturated tones. The inconsistencies in colours are mostly noticeable when you place a more accurate screen side by side.

The TV supports Dolby Vision and HDR10 HDR formats. In HDR, the colour accuracy is better but colours still feel a little boosted.

In HDR, the brightness tracks slightly higher than the reference, as is also noticeable from the PQ curve. This also means bright HDR highlights in certain scenes can feel burnt or clipped on the TV.

In most of the usual content, the HDR impact in scenes with bright elements is noticeable, which is not something we usually get to say for TVs priced under 40k.

Mixed HDR scenes are reproduced rather well.

Performance in Dark scenes is better than on the Vision 9. Since there is no mini LED backlight here, the related artefacts like crushed dark details are also not a problem. But we still noticed a blue tint, more noticeable in dark SDR scenes.

Motion felt best with motion enhancement settings set to Low. The upscaling of legacy content is decent but not great, and we did notice upscaling artefacts every now and then.

DESIGN AND BUILD

The Lumio Vision 7 feels solidly built and comes with a hardened plastic stand. The bezels are narrow and not distracting. The usual connectivity ports you'd need are present on the TV, and they are a bit inside as compared to Vision 9, where they were on the edges.

The bundled remote is stocky and unique. It doesn't scream premium but
