

**SPECIFICATIONS:**

Display: 27-inch, 4K UHD (3840 x 2160), 16:9, IPS, 8-bit with dithering, 60Hz | **Design:** Tilt, height adjustment | **Software:** WebOS 23 with Live Channels | **HDR formats:** HDR10 | **Wallmount:** 100 x 100 mm | **Smart features:** ThinQ Home Dashboard, Apple Airplay, Chromecast Built-in | **Productivity:** Google Workspace, Microsoft 365 apps | **Connectivity:** 2x HDMI 2.0, USB C (PowerDelivery 65W), 2x USB Type-A | **Speakers:** 5W x 2 | **Price:** ₹29,990

suppress reflections without marring the cinema experience.

We recorded a peak brightness of 370 nits, which is again decent for a monitor and an affordable TV. Colour gamut stats are also great. We recorded 100% rec 709 and sRGB coverage. The panel also supports almost 90% of Display P3 colour coverage and around 66% of BT2020 colour gamut.

Now, also note that the 32-inch variant has a VA LCD panel, which will have a higher contrast but will also behave very differently.

Another positive is that Filmmaker mode has made the cut for accurate picture representation, and that is something purists will appreciate. As stated earlier, the colour accuracy is excellent in both SDR and HDR. In SDR we recorded a delta error of just 2.3. Critical memory colours like skintones have an error of less than 2, which is impressive. Bright SDR scenes are handled well. Even the dark scenes have enough shadow details.

For HDR10, this LG monitor tracks the PQ EOTF curve diligently, and we recorded an average delta error of just 1.8. Dolby Vision is not supported, but that doesn't feel like a big omission here. Bright HDR scenes are represented well. Bright highlights don't always pop as much due to limited HDR impact.

As an everyday monitor

The basic Full HD Smart monitors from

LG in the SR50F series are not very good as monitors, because of their low resolution. But that's not the case here. The SR75U series has a sharp 4K resolution.

We have been using this as our primary work monitor for over 3 weeks while writing this review and haven't faced any issues. The text is sharp without any colour fringing. Viewing angles are wide, colours are accurate, and the display feels responsive.

While the white point feels agreeable for work, you can switch to warmer modes and also reduce blue light to make it less harsh on your eyes. So, basically, no complaints here.

Design and connectivity

The white colour scheme makes this monitor feel premium, but should also make it tough to maintain. The bezels are reasonably narrow on three sides and the arc shaped stand base doesn't take too much desk space.

The stand has basic height and tilt adjustment. And yes, unlike on the base models, LG has added a release button to detach and pull off the stand this time.

Behind the monitor, there is a magnetic connector with pogo pins, probably for attaching webcam or some other unreleased accessories. The bundled remote control is slim and easy to use with a decent button layout. There is no voice assistant option, though.

The monitor supports Apple AirPlay and Chromecast Built-in for easy

casting and screen mirroring. Connectivity options cover the essentials and everything most users typically need. You get two HDMI 2.0 ports, two USB ports, and a USB Type-C port with 65W power delivery, which can be used to charge your phone and other accessories. However, options like DisplayPort, useful for advanced users, are not included.

Final thoughts

While the LG 27SR75U might not check every single box for power users or gamers, it nails the hybrid lifestyle. What it does offer is a legitimately good screen for watching OTT content, with the kind of colour accuracy, sharpness, and overall polish that's far ahead of what you'd get with most affordable TVs in the same price bracket. It also does really well as a sharp everyday monitor.

Speaking of which, the high pixel density doesn't just flatter text or UIs but also gives movies, shows, and even YouTube videos a kind of visual snap that made me wonder if 8K might not be that ridiculous after all. This should be a really fun monitor in a college hostel room. It's not trying to be everything, and that works. **id**
