

HP's AI PC Revolution

◀ Vineet Gehani, Senior Director – Personal Systems, HP India

Future of Smarter, Secure, and Sustainable Computing

Yetnesh Dubey | editor@digit.in

With AI-enabled PCs expected to account for over 60% of all personal computers sold by 2027, the race to redefine personal computing has already begun. HP, one of the world's leading PC makers, is betting big on AI-driven features, smarter workflows, and sustainability to stay ahead in this evolving landscape.

We spoke with Vineet Gehani, Senior Director – Personal Systems, HP India, to dive into how HP is integrating AI across its consumer and business laptops, what innovations are shaping their gaming portfolio, how they're addressing hybrid work demands, and why sustainability remains a cornerstone of their future strategy.

Q How is HP integrating AI into its consumer and business laptops?

A HP is leading the charge in integrating AI-driven computing into both our consumer and business laptops, with a focus on enhancing productivity, security, and overall user experience. By embedding advanced AI capabilities across our latest portfolio, we are shaping the future of personal computing along with responding to market needs.

Our next-gen AI laptops, which include the latest HP OmniBook and HP EliteBook series, are engineered to address the evolving demands of a diverse range of users—from content creators and students to businesses and IT professionals. Through these AI advancements, we are creating smarter, more personalized experiences that are fine-tuned to each user's needs, unlocking new levels of efficiency, security, and creativity.

For instance, we've introduced the HP AI Companion, a built-in, intuitive tool that helps users optimize performance, troubleshoot in real time, and make the most of their device's AI features. Through the myHP app, users can access Smart Sense for intelligent thermal management, adaptive performance, and AI-enhanced battery optimization that ensures longer usage on the go.

The platform also supports wellbeing features—like screen time reminders—to encourage healthier work habits. In virtual collaboration, tools like Poly Camera Pro with Auto Framing, Background Blur, and Spotlight are powered by AI to deliver studio-like video calls and content creation experiences. On the busi-

ness front, we're enhancing workflow automation and data analysis through AI, helping teams move faster and smarter. And with HP Wolf Pro Security, AI proactively defends against evolving cyber threats—ensuring peace of mind for enterprise users.

Q Can you elaborate on HP's sustainability roadmap?

A We are committed to embedding eco-conscious practices across our product development, packaging, and overall operations. Our approach is rooted in the principles of a circular economy—designing products that minimize environmental impact while maximizing longevity and efficiency.

A key focus area is our use of sustainable materials, particularly ocean-bound plastic (OBP), which is now integrated into an increasing number of HP devices. Beyond materials, we prioritize product durability and repairability, ensuring our devices have extended lifespans, reducing e-waste, and empowering users to make sustainable choices. Our commitment goes beyond innovation—we actively measure our progress and push the boundaries of what's possible.

Q How does HP plan to differentiate the Omen and Victus series from competitors?

A Our strategy for differentiating the OMEN and Victus series is rooted in a holistic approach that goes beyond hardware, integrating innovative cooling technology, AI-powered
