Facebook: Passkey support against phishing

Meta is ramping up security related to user login and authentication, by rolling out passkeys for Facebook and offering a safer, password-free login using fingerprint, face, or PIN. Passkeys are an upgrade from regular passwords and even one-time SMS codes. According to Meta, passkeys are “resistant to guessing or theft by malicious websites or scam links, making them effective against phishing and password spraying attacks.” Meta says your fingerprint, face scan or PIN used to create the passkey remains on your device and is never seen or stored by the company. This new method protects against phishing and password theft. Available soon on iOS and Android, passkeys will also extend to Messenger and Meta Pay, with setup through the Facebook’s Account Center. tinyurl.com/fbps25

Canva’s new AI feature lets you make videos

Canva has launched “Create a Video Clip,” an AI-powered tool that generates 8-second videos from text prompts using Google’s Veo 3 model. Aimed at marketers, educators, and creators, it’s available to paid and nonprofit users, with a five-video limit. tinyurl.com/ngq54

Android navigation bug for Pixel fixed says Google

The Android 16 stable update introduced a range of new features. While these features are interesting, what Pixel users don’t like is an unwelcome navigation bug that’s making it unresponsive. But it’s fixed now. tinyurl.com/ga16nb

WhatsApp is getting ads with a catch

WhatsApp has announced it will introduce ads but only in the Updates tab, not in personal chats. The platform is adding channel subscriptions, promoted channels, and ads in Status to help businesses and creators grow. Start of a new era for WhatsApp. tinyurl.com/wa6uc

■ **NEW ANDROID UPDATE**

Google rolls out Android 16 with live updates

Android 16 is now live on Pixel devices, bringing live updates on lock screens, cleaner notifications,, and enhanced multitasking for tablets and foldables. For people using

hearing aids, Android 16 brings major improvements. Many hearing aids use built-in microphones, which often

don’t pick up your voice clearly. Now, users can switch to the phone’s mic during calls for better audio in noisy environments. Android 16 also adds native controls for hearing aids, letting users adjust settings like volume directly from their phones. It also has Advanced Protection, Google’s most secure mobile defense yet. With one tap, users can activate features that help protect you from scam calls, unsafe websites, harmful apps and more. Advanced Protection gives you greater peace of mind that you’re protected against the most sophisticated attacks, says Google. More features include HDR screenshots, adaptive refresh rates, and improved accessibility. tinyurl.com/82vc1q
