

■ THE POWER OF SOUND

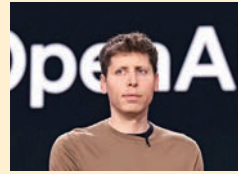

Google tests AI voice chats with new 'Search Live' feature

Google is testing Search Live, a new voice-based AI feature in the Google app that enables back-and-forth conversations. To start, just open the Google app and tap the new 'Live' icon below the search bar. You can then ask something like, "What are some tips for preventing a

linen dress from wrinkling in a suitcase?" and get a spoken response. You can easily follow up with another question like, "What should I do if it still wrinkles?" The conversation continues naturally, and you can dig deeper by checking out the suggested web links shown on your screen. Search Live also works in the background, so you can switch to another app without stopping the conversation. You can even tap the 'transcript' button to see the text version of the conversation. There's also an AI Mode history section where you can revisit and continue earlier chats. Powered by a custom Gemini model, it offers spoken responses, background use, and chat history. Currently in testing for U.S. users enrolled in Labs' AI Mode. Read more about these features here: tinyurl.com/b32fws

OpenAI unveils O3-Pro for smarter, sharper AI

OpenAI has unveiled O3-Pro, a refined version of its flagship O3 model, offering improved accuracy and reliability in science, coding, and education.

The company, according to its internal and academic evaluations, stated that its new model outperformed the O1 Pro and O3 in various categories. OpenAI also claimed that expert reviewers preferred it for its clarity, instruction-following, comprehensiveness, and accuracy. One of the benchmarks used to validate its consistency is the "4/4 reliability" test, where o3-pro demonstrated its ability to correctly answer questions in all four test runs, the company added. This means that o3-pro is particularly useful for users working on complex problem-solving tasks where accuracy and reliability are more critical than speed. Exclusive to ChatGPT Pro and API users from June 10, it includes tools like web browsing and file analysis, though some features remain unavailable. tinyurl.com/O3pgpt

WhatsApp will let you chat without revealing number

WhatsApp is testing a new privacy feature allowing users to create usernames, enabling chats without revealing phone numbers. Aimed at

enhancing anonymity, especially in group chats, the feature is in development with a username availability checker and restrictions on format. Read more: tinyurl.com/was27r
