Opera's new AI browser Neon: 3 Things you should know

A bold new autonomous AI browser that wants to think, act, & multitask

—By **Vyom Ramani**

Opera has unveiled Neon, its vision for the future of web browsing: a fully AI-native, “agentic” browser designed not just to support your online activity – but to do it for you. Neon is still in early access, and most of its ambitious features remain untested in the wild.

Still, the concept behind Neon is too intriguing to ignore. How does it compare, at least on paper, to Microsoft Edge and its built-in Copilot AI assistant? Here's what you need to know.

1) Opera Neon browser uses AI for more than chats

Opera Neon introduces three distinct AI-powered modes, accessible via a sidebar. **Chat**, a conversational AI that can search the web, manage tabs, analyze images, summarize content, and support multilingual and voice queries—acting as a context-aware companion for browsing. **Do**, powered by Opera's

Browser Operator AI, handles tasks like filling forms, booking travel, and managing actions locally for greater privacy and speed. **Make** uses a cloud-based virtual machine to generate websites, games, code, and reports, even continuing work offline and supporting multiple parallel workflows.

2) Agentic AI seems to shine in Opera Neon browser

Opera Neon positions itself as an agentic browser. It's built to understand your intent and carry out complex digital tasks, without constant input.

That includes executing multi-step processes like booking flights, auto-filling paperwork, or even building a website while you're away from your

keyboard. This is a stark contrast to Copilot's user-driven approach, where each task still requires your manual prompt and confirmation.

If Opera's agentic model works in practice, it could drastically reduce the friction of everyday digital tasks – and shift the entire browsing paradigm.

3) Opera Neon claims to be privacy conscious

Opera Neon also aims to do set itself apart with a strong focus on privacy, multitasking performance and monetization (that's a first in browsers, isn't it?). Here's what we know so far.

Privacy First: Most AI features run locally, keeping data like logins, cookies, and history on your device. Only the “Make” mode uses the cloud, and it does so in a secure, isolated setup

Multitasking Power: Neon lets you run multiple tasks at once—like building a game while filling travel forms—something no other mainstream browser offers natively.
