Online shopping fraud

Fake website related frauds, where the unsuspecting are drawn to these sites for online shopping. Request to Pay (RTP) frauds, where consumers are lured to click on links by offering cash credit, lottery win messages and then, extracting the OTP by RTP mechanisms through wallet or mobile pay options.

Consumers need to be aware of one aspect: there is no free money. They should not click links they don't trust. They shouldn't share OTP or PIN numbers with anyone, be it family or friend. Consumers should keep minimal balance in digital wallets.

They need to maintain privacy on social media, and not share information that is personal, or financial. Consumers should enable two factor authentication for all banking transactions.

McAfee

Deepfake + AI threats

Deepfake victims have increased over the past year, with particular vulnerabilities emerging in voice cloning and fake pornographic content. Fraudsters exploit deepfake ads using famous figures online to market fraudulent investment schemes. Impostors posing as government officials intimidate individuals through digital arrests, extracting money under false pretenses. Despite these threats, public awareness remains limited, with a significant portion still struggling to recognise AI-manipulated content.

To stay safe from AI cyber threats, start by verifying sources; utilize fact-checking tools and rely on reputable news sources to ensure authenticity. Examine content, as AI content often contains tell-tale signs like extra fingers or blurry faces.

Online banking fraud

Specifically in the Indian context, some prominent frauds have been phishing attacks to steal information and Business Email compromise (BEC) in case of consumers and businesses, where fraudsters impersonate executives to authorize fraudulent transactions. Some other frauds consumers have been subject to include UPI scams like fraudulent payment request and KYC verification scams where they share personal data. Similarly for businesses, invoice fraud, where fake invoices are presented and account takeover attacks, where criminals gain access to corporate accounts.

When in doubt – never click on suspicious links, as fraudsters constantly refine their tactics. Be proactive with security by keeping systems and antivirus up to date, avoiding public Wi-Fi for transactions.

Kaspersky

Ransomware threats

Indian businesses faced an average of 665 ransomware attacks daily in 2024. These attacks involve “double extortion,” where data is stolen and encrypted, as seen in high-profile cases across sectors. Ransomware families like LockBit have targeted industries from manufacturing to agriculture.

For consumers, the threat extends to offline vectors, USBs infected with malware that spreads. The Trojan-Ransom.Win32.Wanna.m variant has been common. Cybercriminals exploit internet-facing systems with tools like Meterpreter to bypass defenses.

Disable unused services and ports to minimize the attack surface. Keep all systems and software up to date. Keep backups of data, and test recovery methods. Look out for softwares being installed on systems within your network.
