

Motorola Razr 60 Ultra

Not just riding on nostalgia

I still remember school and loved the thrill of flipping open my mom's Motorola Razr2, playing games, hovering over the menu and making calls. It was like I was holding a futuristic device without knowing that flip phones would evolve into what they are today: sleek, functional, feature-packed and so smooth.

Fast forward to 2025, the same company has introduced its flagship Razr 60 Ultra, its most advanced clamshell foldable yet. While many things, including the software, display, performance, and features have evolved in over 15 years, the iconic flip design still remains or I would say it's more durable.

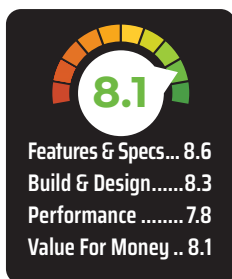

I recently got my hands on the Motorola Razr 60 Ultra and have been using it over the week and one thing is for sure, it's more than a nostalgic callback. The design is better and durable, the in-hand feel is stylish and the cover screen is more capable. I have been using the Razr 60 Ultra as my primary phone for the past three weeks and here are the reasons why I think it might just be Motorola's most exciting foldable yet.

DESIGN

Since we were already talking about the design, the Motorola Razr 60 Ultra comes with some major design changes. The company claims to have finally fixed the durability issues by adding a titanium-reinforced hinge. The company also claims that SGS has certified it to withstand more than 800,000 folds, which is a good number to restore trust in the Razr series after many users raised durability concerns in the past, but how effective it is, only time will tell.

Coming to the protection offered, the Motorola Razr 60 Ultra offers Corning Gorilla Glass with Ceramic Shield, which

₹99,999

is a good thing for clumsy users like me. It also features IP48 certification, which has been the long-standing standard for flip phones. At just 200g and 7.29mm thin when unfolded, it feels lightweight yet premium.

I got the PANTONE

Mountain Trail colour variant, which the company claims offers a real wood finish. However, the texture feels somewhat displeasing. On the front, there's a noticeable crease on the screen, pretty typical for flip phones and something you get used to over time.

DISPLAY(S)

The display is yet another interesting aspect to talk about. The 4-inch LTPO pOLED cover screen can now support a 165Hz refresh rate, HDR10+, 10-bit colour, and full DCI-P3 coverage, with a claimed peak brightness of 2400 nits. In our Calman tests, we measured 850 nits manually and up to 2,640 nits in auto-brightness mode, making it suitable for use in bright outdoor conditions.

The cover display's UI has improved in functionality and usability. There is now extensive customisation support, including different themes, interactive panels, games, and much more.

Inside, the main foldable screen gets a significant upgrade. It's a 7.0-inch 1.5K Super HD pOLED panel, with LTPO and a 165Hz refresh rate. It's Dolby Vision-certified and Pantone Validated, and in use, the screen delivers excellent colour accuracy and brightness. Our tests using the SpectraCal C6 Colorimeter recorded a Delta E of 0.9, which is pretty good and means that you will experience accurate colours whether on the web or watching videos on YouTube. Overall, the display offers a vibrant and fluid experience.

PERFORMANCE

Motorola seems to have paid attention to performance-related feedback from the previous Razr model and it's evident in the new Razr 60 Ultra. The device features a Snapdragon 8 Elite chipset, paired with 16GB of LPDDR5X RAM and 512GB of UFS 4.0 storage, a big upgrade over Razr 50 Ultra. On paper, it's a flagship-ready setup, and in our testing, the performance gains were clearly visible. Benchmark scores, particularly on Geekbench and PCMark Work, show a big improvement over its predecessor.

However, the Razr 60 Ultra still faces the challenge of thermal throttling. In the CPU throttling test, we saw CPU clock speed capping at around 3.53GHz, whereas the company claims 4.32GHz as the maximum. This throttling, where the processor slows down to manage heat better, is common as they have thermal headroom due to their compact build, but not with this device. In our testing, the device maintained around 78% of its peak performance under load, which is respectable. But, heat buildup during heavy tasks was noticeable.

On the software front, I really like it. The UI remains clean and largely bloatware-free. They have optimised the navigation between flips and folds very well. Users get 3 years of major Android updates and 4 years of security patches.
