

The monitor includes a suite of eye care features, like Low Blue Light Plus, Brightness Intelligence or B.I. Gen2, and Night Hours Protection. These can adjust blue light and screen brightness as per preference and ambient light.

BenQ's Night Hours Protection is designed for nocturnal programmers and uses minimum brightness technology to safeguard eyes in low-light settings. It is useful for coding late at night, but also supports all-day use, helping maintain focus and comfort as the lighting changes.

Programmers also benefit from a set of connectivity options, including a KVM Switch, two HDMI Input ports, a display port for daisy chaining, and two USB Type-C ports on the back with support for 90W power delivery. There are also two USB A 3.2 ports, an audio jack and USB Type C ports towards the front to connect accessories.

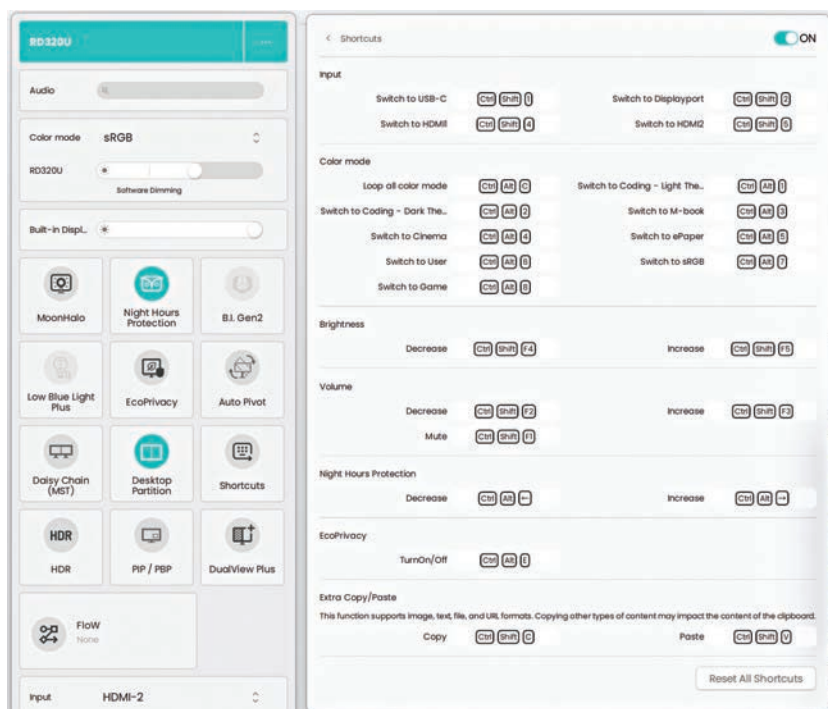

You can take inputs from two sources simultaneously and watch them in Picture-in-Picture (PIP) or Picture-by-Picture (PBP) mode. These features could help improve debugging and testing by enabling real-time monitoring of different environments. It also supports learning by allowing programmers to follow tutorials while coding.

The DualView Plus allows users to work with two different colour modes in two halves. This could be helpful when you have plugged two different sources in PBP mode or if you just want to compare two colour settings before you decide the best one for your needs.

Finally, the DisplayPilot software allows you to easily access all the OSD menu options from your PC instead of toggling back and forth using the joystick. The app is well-designed and works like a charm.

Design and build

RD320U offers a height-adjustment stand that can be customised for height, tilt, and swivel to fit a wide range of user requirements. The monitor is well-built and sturdy but there is a bit of wobble whenever we press the hard buttons. Details like the height-adjustment scale

on the column and a leather-like cable management loop can feel superfluous.

What makes a difference is the MoonHalo backlight, which creates an immersive work atmosphere during late-night sessions. This backlight was reminiscent of BenQ ScreenBar, which

I also found to be quite useful. You can quickly toggle it on by flicking the joystick button. There are options to adjust brightness, and colour temperature and choose between 270-degree and 360-degree modes. There is also an auto-dimming mode for self-adjustment

Verdict

The BenQ RD320U monitor is an exciting monitor tailored for developers and programmers. At the same time, its premium price tag raises questions

about its value proposition and we can't shake the feeling that RD320U is trying too hard. Despite its solid performance, the monitor might appeal primarily to a niche audience willing to invest in these unique capabilities.

The primary focus has been to make the screen as easy on the eyes as possible and to that extent, BenQ has succeeded. Its IPS Black panel ensures deep contrast and wide viewing angles, while the Nano Matte finish minimises glare, making it suitable for long hours of coding. Unique features like dedicated Coding Modes, a customisable Function Bar, and the DualView Plus mode are thoughtful additions. The monitor also integrates robust eye-care solutions, a moon halo light for the feelgood factor, and a great set of connectivity options.

Its a great option for those willing to pay the premium price. **4**
