

ViewSonic VX2758A-2K-Pro-3

A 240Hz wake-up call for budget gamers

Siddharth Chauhan | editor@digit.in

There's no shortage of gaming monitors promising the world for under ₹25,000, but very few actually deliver a balanced mix of high refresh rate, good colour performance, and usable build quality. The ViewSonic VX2758A-2K-Pro-3 sits in that rare space where the specs don't feel like marketing bait. For around ₹20,000, you get a 27-inch 2K IPS panel with a 240Hz refresh rate and AMD FreeSync Premium support. On paper, it's a dream for budget-conscious gamers. But how well does it hold up when you dig deeper?

After weeks of testing, including calibration with Calman and real-world gaming, we've got a clearer picture.

Design and build

There's no RGB. No flashy curves. It doesn't scream "gaming", and that's not a bad thing. It'll sit just as well in an office as it does in a gaming setup.

The chassis is matte black plastic with three slim bezels around the display. It's not premium, but it doesn't feel flimsy either. The metal base is reassuringly sturdy with barely any wobble, even when adjusting angles or typing heavily on the desk.

The bundled stand only allows tilt adjustment (-5° to +20°). That's the first real limitation. No height adjustment, no swivel, no rotation. If you're tall, short, or working on a multi-monitor setup, this could become annoying fast. Thankfully, it's VESA mount compatible

(100×100), so you can invest in an arm if you care about ergonomics, which I would strongly recommend.

Connectivity features

The I/O layout is basic:

- 2x HDMI 2.1 (TMDS mode)
- 1x DisplayPort 1.4
- 1x 3.5mm audio out

That's it. No USB-C, no USB-A, and no built-in speakers. The omission of USB ports means this isn't ideal as a workstation hub, and the lack of speakers may bother some, but in all honesty, most monitor speakers aren't

worth using anyway. If your sole use case is connecting a gaming PC and console, maybe a PS5 or an Xbox Series X, then you're covered.

The joystick-style OSD control works, but menu navigation is clunky and unintuitive. You'll manage, but don't expect polish.

The display

This monitor offers a 1440p, 240Hz IPS panel with support for HDR10 and adaptive sync. It also claims a 1ms MPRT response time. The specs and

features, at least on paper, make it sound like a powerhouse, and in many ways, it is. But it's not without limitations. We tested the colour accuracy, brightness and coverage with Calman and here's what we found:

Brightness and contrast

In wide gamut (DCI-P3) mode:

- **Peak brightness:** 288 cd/m²
- **Black levels:** 0.311 cd/m²
- **Contrast ratio:** ~925:1

In sRGB mode:

- **Brightness drops** to just **124.5 cd/m²**, which is quite dim for day use.

So while contrast and uniformity are solid, HDR performance is mostly marketing and 300 nits of brightness simply isn't enough to do HDR10 justice. You're better off sticking to SDR and tweaking gamma/contrast manually for better visual consistency. This monitor performs best as a strong SDR display with decent colour performance, not a serious HDR performer. The contrast is also typical of IPS displays so don't expect OLED-like blacks or extreme punch.
