

Coding for clean air and clear vision

Three Indian developers using Apple's ecosystem to craft transformative solutions

Manas Tiwari | editor@digit.in

India is home to one of the fastest-growing developer communities in the world. Some of these innovators are now using technology to address pressing challenges. From tackling the pervasive problem of air pollution to democratising access to retinal healthcare, Indian developers seem to have a solution to all problems. Recently, we spoke to three such developers who are using Apple's platforms to craft transformative solutions.

Airveda: Real-time air quality monitoring

Founded in 2016 by Namita Gupta, Airveda addresses and combats the growing air pollution crisis. What started as a mother's mission to protect her children evolved into a health-tech powerhouse, delivering real-time air quality data to individuals, schools, offices, and even rural communities.

"In 2013, I moved back to India from the US. My then 3-year-old daughter was diagnosed with Asthma and she had multiple episodes of Asthma attacks. That's how I got involved in the air pollution conversation, primarily as a mother and an advocate," Namita told us about her experiences.

She soon realised that it wasn't easy to access the air pollution data in India. There were very few monitoring stations and no mobile apps to view this data on

the go. That's when Namita decided to build Airveda for both iOS and Android. With real-time tracking of pollutants like PM2.5, PM10, and CO₂ across over 10,000 stations, the app empowers users to make informed decisions about their environment.

"One of our goals is to democratise air quality monitoring. We have built these personal air quality monitors which are available on Amazon, Flipkart and Blinkit" Namita said, while adding that Airveda also deploys these air quality monitors in various public spaces like schools, malls, hotels etc.

The same solutions are also being implemented in rural areas where the air quality is affected by wood fire burning, crop burning and industrial pollution. "They actually call our devices

their weapons in their war against air pollution," she said.

Airveda has also gotten into partnerships with IIT Kanpur, AIIMS and other institutions for advance public health research. As part of their partnership with IIT Kanpur, Airveda has deployed over 700 sensors in rural Uttar Pradesh and Bihar, helping researchers study air quality in such areas.

Remidio: Revolutionising retinal healthcare with AI

Retinal diseases are a leading cause of preventable blindness in India. Anand Sivaraman identified this and founded Remidio, an AI-enabled medical devices company, that addresses the need for accessible ophthalmic care. And, their solution is extremely cost-efficient too.
