

Remidio uses smartphone-powered retinal camera to identify issues and solve for them.

Using Apple's Core ML, Remidio has embedded multiple AI algorithms into its devices, enabling frontline health workers to diagnose conditions like diabetic retinopathy and glaucoma in

under 10 seconds. This innovation has made retinal healthcare portable, affordable, and efficient.

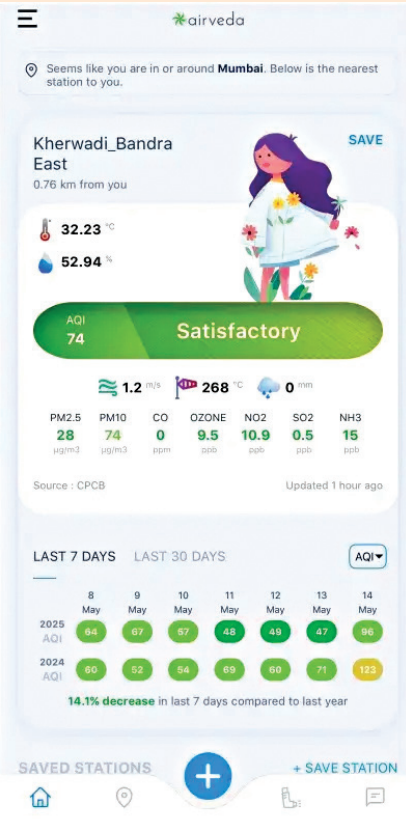

The platform has screened over 15 million patients across 40 countries so far. It has integration into public health initiatives, transforming maternal and child health programs.

Anand's deep expertise in optical imaging and in-vitro diagnostics has been instrumental in driving Remidio's global scaling, with Apple's ecosystem serving as a critical enabler for real-time, on-device AI processing.

Gameberry Labs: Building connections through play

While Airveda and Remidio focus on life-critical challenges, Gameberry Labs offers a different kind of value: fostering human connection. Co-founded by Afsar Ahmad, the company brought beloved board games like Ludo Star and Parchisi Star to smartphones, leveraging Apple's App Store to reach millions.

"The Apple team helped us get the cultural nuances that we lacked. It helped us modify the app for the users. They also helped us with the in general benchmarking for player retention which helped us solve problems," Afsar said.

The social gaming experience Gameberry provides has resonated worldwide, with over 25 million monthly active users – most of which are from countries outside of India. Afsar credits

this to two reasons: lack of Ludo game outside India and the quality of the app.

Gameberry Labs wants to create more table top games and provide better experience to users. >
