

How to use AI in Audacity

For stem separation, noise suppression, Transcription & audio enhancement

Yetnesh Dubey | editor@digit.in@digit.in

Audacity includes integrated AI tools for tasks such as stem separation, noise suppression, and speech transcription, all of which run locally through OpenVINO plugins. These features are particularly useful for creators working with podcasts, music tracks, or interview recordings, enabling them to isolate vocals, clean up background interference, or generate transcripts without needing third-party software or an internet connection.

Performance may vary depending on your system, but for context, I'm using an ASUS Zenbook S14 OLED with 32GB RAM, a 512GB SSD, and an Intel Core Ultra 7 258V processor as my daily driver. In my experience, the

performance has been absolutely fine, even when running heavier models like Whisper for transcription or 4-stem separation tasks.

Step 1: Install Audacity and OpenVINO AI plugins

1. Download and Install Audacity:

- Visit the official Audacity website to download the latest version.

2. Download OpenVINO AI Plugins:

- Access the OpenVINO AI Plugins for Audacity page.
- Download the installer suitable for your system.
- Run the installer, select the

desired AI models (e.g., noise suppression, music separation, transcription), and complete the installation process.

3. Enable OpenVINO in Audacity:

- Open Audacity.
- Navigate to Edit > Preferences > Modules.
- Locate mod-openvino and set it to Enabled.
- Restart Audacity to apply the changes.

Step 2: Perform AI-powered stem separation

Stem separation allows you to isolate individual components (e.g., vocals, drums, bass) from a mixed audio track. This makes it easier to remix songs, remove unwanted elements, or enhance specific parts during editing.

1. Import Your Audio File:

- Go to File > Open and select the audio file you wish to process.

2. Select the Audio Track:

- Click on the track to ensure it's selected.

3. Apply Music Separation:

- Navigate to Effect > OpenVINO AI Effects > OpenVINO Music Separation.

4. Configure Separation Settings:

- Choose between:
 - **2-Stem:** Separates into vocals and instrumental.
 - **4-Stem:** Separates into vocals, drums, bass, and all of the other instruments as well.
- Select the processing device (CPU, GPU, or NPU) based on your system's capabilities.

5. Execute the Separation:

- Click Apply and wait for the process to complete. The processing time may vary depending on how long your track is and the specifications that your hardware has.
