

QUALCOMM'S XR: NOTABLE EXAMPLES

Lenovo ThinkReality A3 (2021):

Announced at CES on January 10, 2021, Lenovo's lightweight enterprise glasses tether to a PC or select Motorola phones to render up to five virtual monitors, 3D visualization and AR-assisted workflows. Compute and AI tasks run on Qualcomm's Snapdragon XR1 platform, chosen for its low power and AR feature set.

OPPO Air Glass (2021):

Unveiled in December 2021 at OPPO INNO Day, this 30-gram monocular waveguide "AR" device houses Qualcomm's Snapdragon Wear 4100 in its slim frame. The chip drives OPPO's Spark Micro Projector and Micro LED display for notifications, translation and navigation via touch, voice, head and hand gestures; retail launch began in China Q1 2022.

Xiaomi Wireless AR Glass Discovery Edition (2023, prototype):

Shown at MWC 2023 as a prototype, Xiaomi's 126-gram wireless AR glasses run on the Snapdragon XR2 Gen 1 platform and a proprietary low-latency link (as low as 3 ms device-to-glasses). Micro-OLED "retina-level" displays and electrochromic lenses impressed, but Xiaomi hasn't announced price or release timing.

Ray-Ban | Meta Smart Glasses (2023):

Introduced in September 2023, the second-gen Ray-Ban | Meta glasses moved to Qualcomm's dedicated Snapdragon AR1 Gen 1 platform. The chip enables higher quality 12-MP

photo/video capture, faster on-device compute and always-on voice for Meta AI, all inside classic Wayfarer/Headliner frames with a slimmer case holding eight extra charges.

X3 Pro (2025):

Revealed at AWE 2025, RayNeo's X3 Pro uses Qualcomm's first-generation AR1 platform (Qualcomm later introduced the smaller AR1+). The SoC's efficiency and computer-vision chops let the 6,000-nit micro-LED glasses stay lightweight while delivering full-color AR; Qualcomm demoed on-glass generative AI to hint at phone-free experiences.

Qualcomm announced that the Snapdragon chipsets will power smart glasses in India. These wearables are being developed in collaboration with brands like Lenskart, signaling Qualcomm's push to introduce AI-powered smart eyewear to Indian consumers.

What about the Xiaomi AI Glasses?

Qualcomm hosted its Snapdragon for India XR Day event in New Delhi, where the Xiaomi AI Glasses made a low-key appearance, sparking speculation about a possible India launch. While there was no official announcement from Xiaomi about whether it is launching the smart glasses in India, its presence at an event focused on the Indian XR ecosystem suggests that the company might be testing the waters for a future release.

Qualcomm's XR event focused on the growing role of spatial computing in India and featured remarks from Qualcomm India President Savi Soin and GM, Mobile, Compute and XR (MCX) Business Unit, Alex Katouzian. Both highlighted the growing relevance of smart glasses and spatial tech and how Qualcomm was powering these experiences. In addition, Qualcomm confirmed that Snapdragon chipsets will power a range of upcoming smart glasses in India, developed in collaboration with companies like Lenskart.

Xiaomi, however, was not specifically mentioned in the list of partners.

That said, the Xiaomi AI Glasses themselves are already commercially available in China, where they launched in June for CNY 1,999 (approx. ₹24,000). Weighing only 40 grams, Xiaomi's glasses offer 2K video recording, a 12MP Sony IMX681 sensor, and feature-rich capabilities like EIS video stabilisation, bone-conduction microphones, electrochromic lenses, and support for live streaming. They even house a 263mAh Surge Battery capable of delivering 8.6 hours of continuous use and charging via USB-C without needing a case.

Xiaomi's decision to showcase the glasses during an India-focused Qualcomm event is notable. Whether this was a one-off demo or the beginning of a rollout remains to be seen. **d**
