

Innovating India

TAKING HUGE STRIDES IN CUTTING-EDGE DEEP TECH

IndiaAI Mission

The IndiaAI Mission is propelling the nation to the forefront of AI with a ₹10,300 crore outlay over five years, targeting a top-five global AI leadership. As of June 2025, India's common compute capacity surpassed 34,000 GPUs, with 17,374 GPUs installed and accessible to developers. Over 367 datasets have been uploaded to the IndiaAI Kosh platform. The initiative backs the development of indigenous LLMs, with 43 out of 506 foundational AI proposals focused on LLMs, each requesting more than 2,000 GPUs. The AI market in India is projected to reach \$7.8 billion by exit 2025, growing at a rate of 20% annually.

Digital India Bhashini

Digital India Bhashini is actively championing linguistic inclusion across India's rapidly evolving digital landscape, currently supporting 35+ Indian languages with over 1,600 AI models and 18 advanced language services as of May 2025. The groundbreaking initiative collaborates closely with more than 50 government ministries, innovative startups, and private organizations to deliver innovative solutions. Bhashini has digitized over 1 billion pages and reached 200 million users through various applications, aiming to deliver digital transformation for over 800 million non-English speakers.

Centres of Excellence in AI

India is rapidly expanding its Centres of Excellence in AI with a new Centre for Education announced in the 2025–26 Budget, backed by a ₹500 crore outlay. Three existing CoEs—focused on healthcare (AIIMS, IIT Delhi), agriculture (IIT Ropar), and sustainable cities (IIT Kanpur)—were set up with ₹990 crore, fostering advanced AI research and public-private collaboration from 2023–2028. These centers integrate AI into critical sectors, scale talent by partnering with 70+ institutes, and are projected to help create thousands of jobs and contribute to India's global AI innovation ambition.

National Semiconductor Mission

The National Semiconductor Mission is ambitiously working to transform India into a leading global semiconductor hub. By mid-2025, six chip fabrication units are under active development, with the country on track to unveil its first domestically produced 28–90nm semiconductor chip by the end of 2025. These cutting-edge fabs are targeting a daily production capacity of 7 crore chips, with investments that are swiftly approaching ₹1.5 lakh crore. The latest HCL–Foxconn joint venture will churn out 20,000 wafers per month, serving key sectors like automotive, telecom, and power.
