

ASUS Vivobook S14 (2025)

Ultra 7 power meets a budget display

A SUS's Vivobook S series has always aimed to bring high-end internals into a

relatively affordable thin-and-light chassis. This year, the 14-inch Vivobook S14 (2025) gets a serious upgrade under the hood with Intel's new Core Ultra 7 255H chip, while retaining the familiar lightweight design. On paper, it seems like a killer package for around ₹90,000, but does the real-world experience match the spec sheet?

DESIGN, BUILD QUALITY, KEYBOARD & I/O

The ASUS Vivobook S14 features a balanced blend of metal and polycarbonate in its construction. The lid is metallic, while the deck is made of plastic, striking a thoughtful compromise between durability and weight. In hand, the device feels solid and well-built, with only a slight flex near the touchpad. The mechanical touchpad itself is larger than expected, smooth, and highly precise, clearly designed with usability in mind. The keyboard also performs well, offering ample key travel and tactile feedback that make long typing sessions genuinely comfortable.

Adding to its appeal is a refined design language. The hinge opens smoothly with one hand, and the laptop maintains a slim profile at just 1.59cm thick and a featherlight 1.35kg, enhancing portability. A CNC-engraved logo adds a subtle touch of elegance, while the clean, straight-line aesthetic keeps things minimal and professional. Available in a neutral colour palette with a metallic finish, the Vivobook S14 feels stylish without being loud, an ideal

choice for both work and personal use-cases.

Durability hasn't been overlooked either. ASUS has subjected the Vivobook S14 to rigorous MIL-STD 810H military-grade testing, which

includes exposure to higher and lower temperatures, shock, and vibration tests. It also features a physical webcam privacy shutter and an IR camera that is built into the top bezel for secure facial recognition, which explains why the upper frame is slightly thicker.

As for ports, it's a balanced layout – 2x USB 3.2 Gen 1 Type-C (with DisplayPort 1.2 and Power Delivery 3.0), 1x USB 3.2 Gen 1 Type-A (left), 1x USB 3.2 Gen 1 Type-A (right), 1x HDMI 1.4, and a 3.5mm combo audio jack.

DISPLAY & AUDIO PERFORMANCE

In terms of display, the Vivobook S14 begins losing ground. The 14-inch IPS panel is matte and anti-reflective, handy under office lighting. But beyond that,

it is fairly underwhelming. Having just 52.7% sRGB, 42.2% DCI-P3, and 46.2% NTSC coverage, it doesn't meet the 2025 standards for decent colour performance. The average Delta E of 4.9 further highlights its poor colour accuracy, making it unfit for any colour-sensitive work or content creation.

Even casual media consumption feels lacklustre due to the dull tones and standard 60Hz refresh rate. The bottom-firing speakers don't do much to compensate either, they're usable in quiet environments but easily overpowered by ambient noise.

OVERALL PERFORMANCE, THERMALS & BENCHMARKS

Performance is where the ASUS Vivobook S14 with the Intel Core Ultra 7 255H really flexes its muscles. In the Cinebench R23

benchmark test, the laptop clocked 16,618 points in the multicore test and 2,047 in the single-core run.

Even under sustained load, it managed a throttled multicore score of 15,370 and a single-core score of 2,045, very respectable numbers. Compared to Apple's 10-core M4 chip, the 255H edges ahead in multi-core tests (as seen in Cinebench 2024) but still trails in single-core where Apple remains ahead. That said, day-to-day tasks like browsing, multitasking, and even light editing feel snappy and fluid.

In the DaVinci Resolve 4K render test, however, the Vivobook S14 took 325 seconds to export, a noticeable gap from the 140 seconds of the MacBook Air M4 and 200 seconds on the Galaxy Book 5 Pro with the Ultra 5 226V. So, for serious content creators, this may not be ideal.

In Geekbench 6 GPU tests, the integrated Alchemist-based GPU in the 255H scored 24,067. That's higher than the Galaxy Book 5 Pro (22,914) but falls behind the Yoga Slim 7i with the 258V (26,132) and Apple M4 (30,965), which continues to lead in GPU tasks.

When it comes to real-world gaming, the Vivobook S14 manages around 25
