

FPS in GTA V, 32 FPS in Dirt 5, and 33 FPS in Shadow of the Tomb Raider at 1080p low settings. These aren't anywhere near gaming laptop numbers, but they're playable for light casual titles.

Thermals and efficiency are equally well handled. At max load, the CPU sips around 35W of power, idles at roughly 15W, and holds a peak temperature of 77°C, while idle temperatures hover around 55°C. After a 30-minute gaming session, the surface temperature remained a manageable 35-36°C.

All of this makes the laptop reliable in terms of performance for most of the non-gaming intensive workloads.

When it comes to GPU performance, the integrated Alchemist iGPU in the Vivobook S14 delivers a decent experience for casual users. In Geekbench 6, the GPU score trails behind both the newer Intel 258V chip and Apple's M4, which benefit from better iGPUs

or Apple's unified memory setup. In real-world gaming tests, the ASUS Vivobook S14's integrated graphics managed around 33 FPS in Shadow of the Tomb Raider, 32 FPS in Dirt 5, and 25 FPS in GTA V—all at 1080p Low settings. These frame rates are passable for casual play but far from ideal for demanding AAA titles. The Alchemist iGPU is suitable for light gaming and older or less intensive titles, but it struggles to deliver smooth performance in graphically intensive games or anything involving ray tracing.

BATTERY LIFE PERFORMANCE

When it comes to battery life, the ASUS Vivobook S14 performs rather decently for a Windows ultrabook. In everyday use, like browsing the web or streaming content, you can expect around 7.5 hours on a full charge. However, during intensive tasks such as gaming, the

battery drains much faster, lasting just about 1 hour and 20 minutes.

While it doesn't match the exceptional efficiency of a MacBook Air or one of the newer Lunar Lake-powered laptops, it's still more than enough for most users to get through a workday focused on light productivity, communication, and media consumption.

VERDICT

The ASUS Vivobook S14 (2025) is a well-built, high-performing thin-and-light laptop held back by a poor display and weak speakers. The Core Ultra 7 255H is excellent, both in raw performance and power efficiency. You also get decent battery life, a solid port selection, and thoughtful extras like an IR camera and privacy shutter. But at ₹90,990, it's hard to ignore the alternatives:

- **Vivobook S15 OLED (2024):** ₹81,990 – Better display, faster CPU (i9-13900H)
- **MacBook Air M4 (2025):** ₹91,900 – Better display, speakers, and battery
- **Lenovo Yoga Slim 7i:** ₹75,990 – OLED screen + Ultra 7

If ASUS brings the price down to around ₹70,000, this could be a great general-purpose pick. But at current pricing, it's hard to recommend over OLED rivals with better screens and comparable performance.
