

FPS support in BGMI. That said, even at 90 FPS, the experience was smooth like butter. During our gaming session, the frame rate held steady with 99.4% stability and an average of 87.1 FPS.

CAMERAS THAT DON'T TRY TOO HARD

Although the Poco F7 leaves some room for improvement on the camera front. But I won't complain because let's be honest, if I am buying this phone, it is most likely to beat my friends in games, not to show off my amazing photography skills. The phone carries a dual-camera setup with a 50-megapixel main sensor and an 8-megapixel ultrawide lens. On the front, you get a 20-megapixel selfie shooter as well.

During its camera test, the weather was a little gloomy, which gave the shots a soft, diffused look. The Poco F7 manages to capture clean and natural-

looking colours. It also tried to manage the dynamic range as much as it could, but it could be better. And most importantly, it retains most of the details without the pictures looking over-processed, meaning it clicks sharp photos.

I think the low-light performance is also pretty solid for the price. There are not too many light bleeds, and the exposure is also managed decently. Plus, we don't get to see too much noise in the shots, but if your subject is in complete darkness, the detail takes an impact.

When it comes to portraits, the edge detection is decent, but textures like hair strands often get flattened, and if you look closely, the borders look a bit artificial. Also, the portrait mode tends to overly beautify the image, with colours popping more than they should.

I enjoyed using its 20-megapixel front camera. You can click sharp and well-exposed selfies with mostly accu-

rate skin tones. Fortunately, this phone doesn't aggressively smoothens the skin like we see on other phones.

THAT 7550MAH BATTERY IS THE REAL MVP

The most powerful weapon in the Poco F7's arsenal is its 7550mAh battery. I tried killing it in a day, but barely made a dent. All the performance testing earlier only drained 17% of its juice.

In our PC Mark Battery Life test, the Poco F7 clocked an impressive 23 hours and 25 minutes, our best score yet among mid-range phones. So yeah, you can easily expect two to three days of screen time on a single charge.

Speaking of charging, it supports 90-watt fast charging, which takes it from 0% to 100% in about 85 minutes. Now I know a lot of phones these days top up in under 50 minutes, but do they carry a battery this big? Nope!

CONCLUSION

The Poco F7 feels like that overachiever kid in class who outperforms without showoff. Although the camera is not going to win awards, but it gets the job done. Add to that smooth 90 FPS gaming, you have got yourself a genuine "Flagship Killer" when it comes to performance. This phone is made for the speed and solid value.

—Mustafa Khan

SPECIFICATIONS

Display: 6.83-inch 1.5K display, 120Hz refresh rate | SoC: Snapdragon 8s Gen 4 @ 3.2GHz | RAM: 12GB | Storage: 256GB | OS: Xiaomi HyperOS 2 | Camera: 50MP main camera Sony IMX882 + 8MP ultra-wide + 20MP front camera | Battery: 7550mAh, 90W fast charging | Weight: 216g | Other: Type-C port, Wi-Fi 7, Bluetooth 6.0
