

AMOLED panels with sharp colours, 120Hz refresh rates, and tight bezels. You'd be hard-pressed to pick a favourite.

But step outside, and the difference becomes blindingly obvious. The Vivo X200 FE hits a peak brightness of 2,750 nits, outshining the OnePlus 13s' ~1,700 nits. This matters when you're editing photos in sunlight or trying to read a WhatsApp message outdoors.

OnePlus offers warmer, more saturated tones, which are great for streaming and Instagram scrolling. But the Vivo's panel is more accurate, calibrated to the kind of fidelity that creators and photographers will appreciate.

Verdict: *Vivo wins for creators and outdoors. OnePlus looks great indoors.*

Performance

On paper, the OnePlus 13s has the upper hand. That Snapdragon 8 Elite is a 3nm beast, breaking past 2.5 million on AnTuTu and BGMI running at 120FPS. Thermals are impressively managed. It's pure and raw flagship speed.

The Vivo X200 FE's Dimensity 9300+ uses an all-performance core layout, no efficiency cores here. It scores lower (around 1.8 million) and caps BGMI at 90FPS. However, it feels just as fast in daily use. App launches, multitasking, camera switching, it's all fluid.

And here's the revelation: Vivo stays cooler during prolonged tasks. Recording 4K video for 20 minutes isn't a problem for the X200 FE, and the vapour chamber cooling does its job.

Verdict: *Gamers and benchmark junkies should lean toward OnePlus. But Vivo is no slouch, and arguably smarter with thermals.*

Battery impact

How Vivo managed to fit a 6,500mAh battery into this chassis is impressive. OnePlus counters with a still-generous 5,850mAh cell. On paper, Vivo wins. In practice, it's closer than you'd think.

The PCMark battery tests had the OnePlus lasting about 90 minutes longer, roughly 22 hours vs 20.5 hours. That's likely due to Snapdragon's

efficiency. Vivo claws back with 90W charging, that's a few minutes faster.

For most users, both phones will last a day and a half. If you're a traveller or a mobile creator, someone who doesn't always have a plug around, Vivo's larger tank might be the better bet.

Verdict: *Draw. OnePlus lasts longer. Vivo charges faster. Pick your priority.*

Camera performance

Let's not sugarcoat this: the Vivo X200 FE wipes the floor with the OnePlus 13s in its camera versatility and output.

Both have 50-megapixel main sensors (Vivo's Sony IMX 921 vs OnePlus' Sony LYT-700). But only Vivo adds a 3x periscope zoom and a usable ultrawide. It's a full trio of perspectives, backed by ZEISS optics and colour science.

Portraits look cinematic, with DSLR-level realistic blur, and the impressive 10x hybrid zoom: I captured a squirrel from across a park and could make out individual whiskers. Vivo pulls ahead in Night mode with better skin tones and less aggressive noise reduction.

The OnePlus 13s, by comparison, is functional. Daylight shots are clean, and the dynamic range respectable. There's no ultrawide, and no zoom past 2x. You feel boxed in, creatively speaking.

Selfie lovers, take note: Vivo records 4K at 60fps on the front camera. OnePlus caps out at 4K 30. If you vlog or FaceTime a lot, that's a real difference.

Verdict: *Vivo is for casual filmmakers while the OnePlus is just... fine.*

Software and updates

OxygenOS on the OnePlus 13s remains one of the cleanest Android skins, fluid, stable, and armed with thoughtful AI features like live transcription. The customisable Plus Key is useful too.

Funtouch OS on the Vivo X200 FE still feels heavier, but it's grown up. It doesn't lag. The camera app is full of smart tricks such as the Reflection Erase and Magic Move, which sound gimmicky at first but actually work when you're editing on the go.

Both brands promise long-term support. OnePlus offers 4 years of Android updates and 6 years of security. Vivo offers 4+5, which is not bad.

Verdict: *OnePlus wins for clean, fast UI. Vivo for creative tools baked in.*
