

Card Analyse MVP

Founder Interview (Tanish Mittal)

Met Tanish Mittal, the 19-year-old behind Card Analyse, a tool born out of everyday financial chaos. Currently a B.Tech student at SRM IST Ghaziabad, Tanish is a builder at heart who prefers solving real-world problems. He's crafted a product that helps users make sense of their money by parsing Gmail for hidden subscriptions and silent transactions. Card Analyse isn't just another finance app, it's a solution that's resonating with a much wider problem.

Q How did this idea strike you?

A In college, managing money was chaotic, I'd receive 5000 rupees one day and I'd be down to 1000 the next. It wasn't even major spending, but what really messed with me were auto-renewing subscriptions like Spotify and Netflix. I once spotted a ₹199 charge from a name I didn't recognize, I thought it was a fraud but turns out, it was a subscription with a different billing name. That's when it clicked: I don't know where my money is going, I had no visibility. Alerts were scattered – Gmail, SMS, or missing. So I built a tool to scan Gmail for transaction alerts, categorize them, and show a clear view.

Q Is this even legal? Aren't there compliance risks?

A Yes, it's legal. We use Google's OAuth 2.0 process, users explicitly grant access. We follow Google's API policies and are working toward verification. When users connect their Gmail, they grant permission to read specific emails, like bank alerts and receipts. Nothing is accessed without their full consent. Ethically, we only read financial alerts and never touch personal content. This tool exists to give users control over their own

money, not take it away. Ethically, that's the entire point.

Q Is the data you access stored?

A We only access transactional emails – card payments, subscriptions, UPI receipts. For the MVP, data is processed in real time in the cloud and discarded immediately. No storage yet. Future versions will store encrypted data securely only when for features like trend tracking.

Q What's the architecture?

A Built with Python and Streamlit, frontend and backend combined. When a user connects Gmail, we use the Gmail API to fetch and parse alerts on the fly. It's cloud-hosted but lightweight. Later, we'll move to a full-stack architecture for scalability.

Q Why Gmail parsing over UPI APIs or Account Aggregators?

A Speed and accessibility. Account Aggregators need regulatory approvals, which slow things. Gmail already has the data, subscriptions and OAuth gave us a fast, legal way to start. Parsing is messy but gets the job done for MVP. Long-term, we'll integrate with AAs and UPI APIs.

Q How do you categorize?

A We use a lightweight AI model. It identifies merchants (like Zomato, Netflix) and assigns categories like Food, Travel, Subscriptions. For lesser-known names, it uses context from the email. No manual mapping,

Q What's the long-term goal?

A To become a silent personal finance layer, detecting subscriptions, unusual charges, trends, and giving users clarity. The big vision? A world where no one has to ask, "Where did my money go?" 

NEWS UPDATE

Motor AI has raised \$20M to scale autonomous robotics globally

Motor AI has raised \$20 million in a Series B funding round to expand its autonomous driving software and robotics platform for industries and logistics. Led by Walden Catalyst and NGP Capital, the funding will accelerate its Sherpa line of autonomous mobile robots, which are in use at over 40 sites, including major clients like Hyundai and Forvia. These AI-powered robots operate indoors and outdoors, transporting 1,000 kg while navigating using LIDAR and 360° vision.

NotebookLM adds curated notebooks from The Economist and The Atlantic

Google has updated its note-taking AI, NotebookLM, with a new "featured notebooks" section that has curated content from publishers like The Economist and The Atlantic. These notebooks cover longevity, and literature, and are designed to help users explore subjects easily using AI tools like summaries, Q&A, and audio guides. The update builds on growing public interest, following over 140,000 shared notebooks last month, and signals Google's intent to make NotebookLM a go-to platform for learning and research with high-quality content.
