

Inside the Acer-Qualcomm alliance

Reimagining laptops for the AI age

Mithun Mohandas | editor@digit.in

As laptops evolve to meet the demands of an AI-first, always-connected world, partnerships like the one between Acer and Qualcomm are shaping what the future of personal computing looks like. In this exclusive conversation with Digit, Sudhir Goel, Chief Business Officer at Acer India, and Saurabh Arora, Head of Mobile, Compute and XR Business, Qualcomm India, share how their deep co-engineering effort is redefining what users can expect from their devices. From on-device AI to all-day battery life, fanless designs, and 5G-ready platforms, they unpack how Snapdragon-powered laptops are changing the rules of mobility, productivity, and performance in the hybrid work era.

Q In your view, what differentiates your partnership from other collaborations in the tech industry focused on laptop innovation?

A Sudhir Goel – What sets our partnership with Qualcomm apart is the shared vision to redefine the laptop experience, not just improve it incrementally. By integrating Snapdragon technology, originally built for mobile, we can deliver laptops that are ultra-thin, fan-less, and exceptionally power-efficient. This unique archi-

ture unlocks real advantages for today's users: extended battery life, always-on connectivity, and responsive AI-driven performance. It's not just about specs; it's about reimagining what mobility, productivity, and seamless user experiences can look like in a new generation of devices. Together, we're building solutions that meet the evolving demands of hybrid lifestyles and work-from-anywhere expectations—something traditional PC configurations struggle to match.

A Saurabh Arora – As a global tech leader, we have proven expertise in innovative technology. Our vision is to drive the convergence of mobile and

PC, bringing the best of innovation to your laptop. The partnership between Acer and Qualcomm goes beyond a typical one. It is an engineering effort, where both companies work together on every layer of development, from hardware to software integration.

This level of integration allows us to unlock the full potential of Snapdragon. Together, we are redefining the personal computing experience and enabling developers to efficiently create apps for this new generation.

Sudhir Goel
Chief Business Officer,
Acer India

Q Can you discuss specific Acer devices or product lines that have significantly benefited from Snapdragon technology integration?

A Sudhir Goel – The Acer Swift 14 AI laptop stands out as a prime example of how Snapdragon technology has

significantly enhanced our product offerings. Powered by the Snapdragon processor, this device benefits from exceptional power efficiency and thermal management, which allows for a sleek, fanless design that keeps the laptop slim and lightweight. Unlike traditional processors that generate more heat and require bulky cooling systems, Snapdragon's system-on-chip architecture helps us create devices with longer battery life and greater portability, key factors for today's mobile users. This integration enables the Swift 14 AI to deliver next-generation performance and mobility, making it ideal for professionals and consumers who demand style and substance in their laptops.

Q With AI integration into Snapdragon-powered laptops, what specific productivity enhancements should end-users expect?
