Samsung's foldable ambitions grow

As durability, AI integration take centre stage

Manas Tiwari | editor@digit.in

The smartphone industry is going through a time where hardware innovation has become harder to come by. At a time when most OEMs are skeptical of experimenting, Samsung believes that the future is foldable phones and has been continuously making them better. Coupled with Artificial Intelligence and an intuitive software, the company aims to put foldable phones at par with bar phones.

At a recent media roundtable in New York, Won-Joon Choi, the President and COO of Samsung Electronics' Mobile eXperience (MX) Division and Head of R&D, laid out the company's evolving strategy around foldables, AI integration, and long-term durability – the three pillars that will underpin its next phase of growth.

Central to the discussion was a concern that has loomed large since the first Galaxy Fold was introduced

in 2019: durability. Despite consistent improvements in design and materials, skepticism remains among many users about the longevity of foldable screens and the reliability of hinges over time.

In response to a question on the same by Digit, Choi said that durability is one of Samsung's core values. "For the Galaxy Z Fold 7 and Z Flip 7, you will see that although the designs have become sleeker and lighter, the durability has actually improved," he said.

The company has made notable strides in materials, internal components and structural engineering to ensure that foldables are built to last. "This effort will not stop. Technological innovation for better durability will continue," he added.

Since launching the original Fold, Samsung has treated foldables not just as a product line but as a long-term bet. In the premium segment especially, the company now considers foldables among its most critical offerings. "Foldables are no longer a niche
