

1. Install GIMP

- Download and install GIMP (version 2.10 recommended) from gimp.org.

2. Download Stable Diffusion plugin

- Use the official “gimp-stable-diffusion” from GitHub

3. Add your API key

- Register at stablehorde.net > copy your API key > create a API.KEY file..
- Save it in %AppData%\Roaming\GIMP\2.10\plug-ins\

4. Install plugin files

- Extract the downloaded ZIP and place the .py files into the same plug-ins folder.

5. Restart GIMP

- You'll see a new AI menu: use Text>Image, Image>Image, and inpainting.
Image sizes must be multiples of 64 px; renders take a few minutes per 1024×1024 canvas.

3. Clipchamp – AI Video Trimming & Captioning

Turn raw footage into a video with auto-captioning, silence trimming, and smart edits, all free and with Windows.

How To Use Clipchamp:

- Open Clipchamp (It is built into Windows 11).
- Import your video files.
- Click Auto compose to generate some cut suggestions.
- Enable Captions > Auto-generate to overlay accurate subtitles.
- Use Silence detector to trim long pauses automatically.

No sign-in or subscription needed, perfect for quick creator edits.

4. Windows Studio Effects – NPU-Powered Webcam Enhancements

Upgrade your webcam with eye contact correction, auto framing, background blur, and voice focus, fully processed on-device.

How to enable Studio Effects:

- Go to Settings > Bluetooth & Devices > Camera.
- Select your built-in webcam.
- Toggle Eye Contact, Automatic Framing, Background Blur.
- In Settings > Sound > Input enhancements, enable Voice Focus, if available.

Works live in Zoom, Teams, OBS, all without uploading any data.

5. Phi-3 Desktop Assistant (via LM Studio) – Offline ChatGPT

AI laptops today can do more than just run Chrome fast. Thanks to built-in NPUs and efficient CPUs like Intel Core Ultra and AMD Ryzen AI, you can run small AI language models (like tiny ChatGPTs) directly on your laptop without an internet connection.

These lightweight models, such as Phi-3, Mistral-7B, or Gemma, are small enough to run locally using apps like LM Studio. Set up Phi-3 locally:

1. Download LM Studio for Windows

- Go to the official site: <https://lmstudio.ai>
- Click on the Download for Windows button. It's a free app and has a standalone installer.

- Once downloaded, run the installer and follow the setup instructions.
- LM Studio does not require coding, just a modern Windows PC with at least 16GB RAM (32GB recommended for smooth multitasking).

2. Install a Phi-3 Model

- After launching LM Studio, go to the “Models” tab in the left sidebar.
- In the search bar, type “phi-3”.
- You'll see options like:
 - phi-3-mini-4k-instruct.Q4_K_M.gguf (It is meant for ultra-light-weight performance)
 - phi-3-small-128k-instruct.Q4_K_M.gguf (It is a slightly larger version meant for even more context memory)
- Click “Download” on the version that suits your RAM/GPU capacity. For most users, “phi-3-mini” is a great starting point.

3. Launch the Local Chat Window

- Once the model is downloaded, go to the “Chat” tab.
- In the dropdown menu, select your downloaded “Phi-3 model.”
- Click “Start Chat” to launch your private, offline AI assistant.

4. Start Chatting Offline

- Type your question or prompt into the message box.
- Adjust advanced settings if needed:
 - Temperature: Controls creativity (0.2 for factual, 0.8+ for creative)
 - Top-p and Max Tokens: Controls response randomness and length
- Hit “Enter”, and the AI will respond, completely offline.

If your laptop has an NPU, LM Studio will accelerate it for you.

You don't need ChatGPT-Plus or cloud access to experience AI-powered productivity on your computer. With these five tools, whether for transcribing, editing, creating, enhancing, or chatting, you can do powerful AI tasks locally, with zero cost and full privacy. Ideal for smart laptops: let them shine without compromise. **d**
