

just raw power, it's the flexibility. Qualcomm's Digital Chassis offers modularity across cockpit systems, ADAS, infotainment, and cloud services. Whether it's an entry-level scooter or a luxury EV, OEMs can pick from performance tiers and software stacks that suit their needs. Instead of forcing a one-size-fits-all model, Qualcomm offers flexible tiers that OEMs can mix and match across different vehicle segments.

"We're not in the ASIC business," Don clarified. "But we do customise platforms. And we let OEMs mix and match. You want Flex SoCs that bundle ADAS and cockpit together? Done. Prefer them separate? Also fine."

This versatility is especially important in markets like India. "We were the first to ask, why can't two-wheelers have intelligent systems?" Qualcomm sees the untapped two- and three-wheeler markets as a vital frontier. With Snapdragon at the heart, even low-cost mobility can get high-end smarts, from contextual navigation to real-time vehicle diagnostics.

"The idea is to let automakers build smarter, safer, more connected vehicles on their terms," he added.

Edge computing meets ethical AI

At the philosophical level, this collaboration is about trust. Both will.i.am and Qualcomm believe AI should not just be smart, it should be responsible.

Snapdragon's latest chips can run billions of parameters on-device, powerful enough for real-time inference, secure enough to keep your data yours. "The edge is privacy. The edge is sovereignty," Don said about systems that don't rely on constant cloud connectivity. This ability to host large models locally is what makes products like FYI Radio viable and trustworthy.

In will's words: "We're not building AI sheep. We're building agents that respect human intent."

India: Not just a market, but a launchpad

Qualcomm's ambition in India goes far

beyond just partnerships. With teams in cities such as Chennai and Bangalore, and a commitment to R&D for the local market, the company is positioning India as a global nerve centre for edge intelligence.

"We're not adapting global tech for India," said Don. "We're building for India, with India, from day one. This is where the next frontier is. And we're going there fast."

Qualcomm's vision is clear: Snapdragon won't just power the next generation of infotainment. It will be the intelligence behind mobility, media, and everything in between.

Agentic future: Beyond apps, into interaction

will.i.am closed with a provocative thought: "This isn't about apps anymore. It's about agents."

Snapdragon's edge infrastructure is what will power those agents, not just in your phone, but also in your car, your headphones, and your life. A new App Store moment is coming soon, but this time, it's not about software you open. It's about intelligence that opens up to you.

And when that moment arrives, Qualcomm won't just be there. Snapdragon will be inside. **Q**
