

The urgent case for C-V2X

Why India shouldn't wait any longer

Qualcomm has been actively championing the use of Cellular Vehicle-to-Everything (C-V2X) as a transformative safety solution for India's roads. With real-world deployments already underway in global markets such as China, Europe, and the U.S., C-V2X is now emerging as a practical and scalable solution for India's mobility ecosystem.

It doesn't come across as a sales pitch or a technical deep dive. Instead, it presents a pragmatic case for why India should treat C-V2X not just as another automotive upgrade, but as a public safety tool that fits neatly into the country's broader transportation challenges. The message is subtle, but clear: the building blocks are here, and now it's about putting them together.

The timing couldn't be more relevant. Qualcomm's Snapdragon Auto Day, being held on July 30, is expected to put C-V2X and connected vehicle platforms front and centre. While the event will spotlight next-gen automotive tech across categories, the focus on C-V2X could offer a clearer view of how the technology is evolving in India.

What exactly is V2X, and why does it matter?

V2X is short-range communication that lets vehicles exchange real-time data with other vehicles (V2V), road infrastructure (V2I), and pedestrians (V2P). Think of it as a sixth sense alerting your car of a speeding ambulance, warning a scooter rider of a red-light

jumper, or letting trucks know there's a cyclist just around the corner.

Interestingly, it doesn't rely on mobile towers. V2X works over a dedicated 5.9 GHz spectrum, offering interference-free, line-of-sight communication. And it operates consistently – rain or shine, day or night.

This isn't just about futuristic mobility, it's about enabling real-time awareness in everyday traffic scenarios. For instance, V2X can detect and warn about potential col-

lisions, even when a driver's view is obstructed. It also alerts drivers when emergency vehicles are approaching, helps navigate intersections by signalling traffic light status or unsafe turns, and notifies drivers about hazardous road conditions like construction zones or slippery surfaces.
